## PREFACE TO THE NEW (FOURTEENTH) EDITION.

---

THE first draft of this book was made in 1879, while the author was teaching, and still studying, at the Conservatory of Music in Stuttgart, Germany. It was many times rewritten before being first issued in 1882, in Stuttgart. In this original form it was used until 1889, when, in completely remodeled form, it was published by Mr. Schirmer in America. In 1895 it was again partially revised. For the present edition it has been again thoroughly revised, rearranged and re-written.

The object of this latest revision was, to record the experience gathered during the past twenty years of uninterrupted teaching; to correct prolix and clumsy diction; to increase the exercise-material, especially in melody harmonization; and to introduce and systematize, as far as possible, the novel experiments and achievements of modern harmonic thought. Also, to present the book, as a whole, in a more attractive and useful form.

PERCY GOETSCHUIS.

NEW YORK, *October, 1912.*

### EXTRACTS FROM THE PREFACE TO THE FIRST AND SECOND EDITIONS.

---

THE author is not inclined to the sanguine belief that such a subtle and imaginative art as that of composition can be acquired by those not possessed of the innate faculty, by simply studying from books. But it is certainly true, that even those who are born to compose are not exempt from the necessity of a careful training, systematic arrangement and studious development of their ideas. It is therefore essential that the musical student be guided in his studies by some method in which the primitive laws of the art (as instinctively recognized by genius), and the subsequent experiences and inventions of distinguished minds (as transmitted through classic productions), are comprehensively and truthfully recorded; and that method which most lucidly, concisely and *systematically* imparts such information is the one from which the scholar will derive the greatest benefit.

In opposition to the still popular impression that such books as these are written only for the use of composers, and that only those who intend or hope to become composers ever need to study harmony, the author avers his belief that none of the many branches of musical discipline is so indispensable as that which treats of the Science of music; and he therefore wishes to be understood as having prepared this treatise *more particularly for the musician in general, than for the very small minority of composing musicians.*

\* \* \* \* \*

The students in whose hands this book is to be placed, are assumed to have *completely* mastered all the elements of notation; to be reasonably expert in piano playing, and in reading at sight (for which the easier Sonatas of Mozart or Haydn may be offered as tests); and to be somewhat familiar with classic literature. If this is not the case, they are urged to devote a few months to the acquisition of this indispensable knowledge before commencing harmony; *for neither from this nor from any other book can the study of harmony be successfully pursued by any student whose attention is still partly engrossed by the rudiments of music.*

This method of harmony is based upon the method of Prof. Dr. Immanuel Faisst, for a detailed account of which the author is indebted to the interest and kindness of Dr. Faisst himself. (See the following Preface.)

The present author's knowledge of harmony was obtained solely through this channel, and he takes pleasure in avowing that what he has since learned is due to the influence of Dr. Faisst's incomparable mode of instruction.

But in the preparation of this book the course of instruction received by the author has undergone many, in part radical, modifications. \* \* \* \* Chief among these,—as defining the main standpoint assumed in this method in distinction to all others, and as indicating the source from which the laws of harmonic action and logical tests of euphony are deduced, — are paragraphs 12,\* 13, 18, 24, 34, 46c, 59, 68, 69, 70, 78, 101, 171, 198, 259, 262, 267, 302, 307, 315, 323, 339, 346, 358, 376, 390, 405, 414-419, 425, 427, 462. These, and the fundamental laws of melody; the treatment of melody-harmonizing; the treatment of the altered and mixed chords; and the fundamental laws and processes of modulation, — the author believes to have originated.

---

This second, re-written edition differs from the first one in the following respects: The different subjects of study have been more distinctly and methodically systematized; the explanatory notes and illustrations are more copious; and the exercises have been made easier, so that every ordinarily gifted scholar may have the gratification of correctly solving them, with a fair amount of application and patience. \* \* \* The course of study is divided into Lessons (weekly, or semi-weekly) in such degrees as the author has found to be most convenient in his own practice; but it is left to the judgment of the teacher to modify this division as occasion prompts. It will oftener be found necessary to devote the time of two lessons to one alone, than to merge two lessons in one: haste is of little avail in the study of harmony. Each lesson terminates with an exercise, or a set of exercises, and a synopsis of the fundamental principles of the subject under treatment. The author recommends working out *all* the given basses and other exercises, upon the ground that "practice will make perfect." The adoption of the given positions (upper figures) facilitates the solution of the basses very materially, of course, and they are really intended only for the use of weaker pupils. Those who are ambitious to profit most by the given exercises will *simply ignore all such auxiliaries, i.e.,* will copy out the given basses without paying any attention to the upper (position) figures. The fundamental principles should be memorized.

The references to other paragraphs (which may appear at first glance unnecessarily profuse) have been made with the studied purpose of impressing certain points more deeply upon the scholar's mind, by dint of frequent repetition. Therefore, he is required to make conscientious use of them, despite the slight interruptions they may cause. In the other references (to other works) the author has limited himself as much as possible to such compositions as are accessible to every scholar, and, with very rare exceptions (in favor of some particularly striking examples), to pianoforte music alone. The printed examples, of which those not otherwise marked are original, are the more pointed illustrations of the matter in question, and are so copious that the references, if unobtainable, may be dispensed with.

\*These paragraph numbers refer to the present, latest, edition.

## PREFACE OF DR. FAISST.

---

The method of harmony upon which the present work of Mr. Percy Goetschius (published with my assent) has been based, was originally prepared by me in 1847, for the purpose of instruction in a musical Institute; and was subsequently — certain parts repeatedly — revised. After having used it in this manner for a period of ten years, the establishment of the Stuttgart Conservatory of Music, and my acceptance of the proffered position among its faculty, gave me occasion for a new and more extended application of my method, by reason of which it naturally grew more and more complete; albeit I gave the lessons without the aid of manuscript notes, and extemporized the examples and exercises directly upon the blackboard. In one of these Conservatory-courses, my system of instruction was written down as accurately as practicable in text and notes by a scholar who was afterwards engaged in my stead as teacher of the branch in question, and who gave the lessons according to his manuscript copy. Through a similar medium, Mr. Goetschius, to whom I subsequently had the pleasure of imparting instruction personally in the higher branches of composition, came into possession of this part of my method.

As I have been unable as yet for lack of time, and may possibly never find time, to elaborate this branch of study consistently with my wishes for publication, I would not oppose the author of the present work in his intention of preparing a system of harmony, which, though based upon the method which I have applied, contains various modifications and original additions. But, on the other hand, it may be no more than just that I should, in this place, support my right of invention and application to such subjects and such modes of treatment as, to the best of my knowledge, distinguish my method from prior modes of instruction; especially in view of the possibility that parts of this method which are peculiar to myself, might later be adopted in other — perhaps even German — didactic books.

The points which I believe I have originated, are as follows:

The adoption of an “absolute” figuring for all the chords. That is, a designation in numbers, which, without the necessity of a written bass, indicate the species of the chords and their exact situation in the key; not only in reference to their roots, but also to their denomination (as triad, chord of the seventh or ninth), and to the grade of inversion; — for illustration,  $\overset{7}{\text{II}}_1$ ,  $\overset{9}{\text{V}}_3$ . Further, the noting down of exercises in numbers according to this system, to be worked out in different keys.

The abbreviated denomination of all the chords, according to the numbers used in this “absolute” figuring; *e.g.*, the Two-seven-one.

The regard paid to the eminent influence which in all chords (above all in the concords) the condition of the soprano exerts upon the admissibility and effectiveness of the chord-progressions; and, in consideration of this influence, the investigation and judgment of all the diatonic harmonic progressions, with regard to every possible soprano-position; furthermore, in the same connection, inciting and guiding the scholar to a melodious progression of the soprano, in every kind of exercise.

The institution of rules for voice-progression, which are not limited to a succession of two tones, but apply to the connection of a protracted series of tones.

The application, throughout, of each part of the harmonic material, in a threefold manner:

(a) In working out figured basses;

(b) In the invention, by the scholar, of original phrases and periods; in both cases with special regard to the acquirement of these simple, elementary forms in regular construction, — for which reason, the suitability of the momentary chord-material for semi-cadences is also indicated;

(c) In harmonizing given melodies, chiefly in these elementary forms, or in other related forms proceeding from them.

The determination of the relations existing between the laws of rhythmic progression, and the prolongation or change of chords and bass tones.

Many rules of voice-progression for special combinations of chords; particularly in reference to covered, interrupted, and oblique consecutive octaves and fifths.

The distinguishing between different kinds of parallel fifths, according to their size, and the condition of the voices.

Precise definition of the harmonic relations and general use of the different six-four chords of the key.

Thorough exposition of the free resolutions or progressions of discords, and their use; also the free resolutions of suspensions.

Regulations respecting the practical application of the diminished triads, and their inversions; of the chords of the ninth, and inversions; the chord of the seventh upon the 7th step in major, with its inversions; of the altered and mixed chords.

The derivation of the chord of the seventh upon the 4th step, from the chord of the ninth upon the 2nd.

The distinction between, and separate treatment of, diatonic modulation (based upon the fundamental principle that certain chords are *common* to different keys) and chromatic or enharmonic modulation; diatonic modulation to remote keys, direct and indirect; precise exposition of the different chromatic chord-progressions, and their modulatory significance.

Rules for determining the admissibility of cross-relations.

Detailed treatment of harmonic and mixed figuration.

The transition from the harmonic (homophonic) style of writing to the polyphonic, by means of inharmonic tones.

All these characteristics, which I believe to be peculiar to my method, have been adhered to with more or less fidelity by Mr. Goetschius in the present work. But, while it would be groundless to regard each individual point in the presentation and treatment of these subjects in this book as proceeding from me (inasmuch as Mr. Goetschius has deviated in many respects), it would be still less just to overlook what he has done to complete certain parts of my method, and present it in a fitting shape for practical instruction; besides the addition of those parts, in reference to which he in his preface lays just claim to having advanced original views, the significance of which will not be denied even by those who are unable promptly and easily to appropriate them.

May this book then, which has been prepared with so much intelligence and assiduity, prove to be a successful guide to very many in their musical studies.

DR. IMMANUEL FAISST.

STUTTGART, *October, 1882.*

The Pastoral Organ-point . . . . .	183	The Passing-notes, as "Progressive" Embellish- ment . . . . .	211
Irregular Organ-points. — The Mediant Organ- point . . . . .	185	Embellished Melody, and Running Parts. . . . .	212
The Short Organ-point . . . . .	186	Embellished Harmony . . . . .	215
Section 2. The Suspension.		Irregular Neighboring-notes. The Appoggia- tura . . . . .	219
Hints and Directions . . . . .	189	The Double-neighbor . . . . .	220
Harmonic Suspensions . . . . .	190	Harmonic Embellishment, continued . . . . .	222
Suspension-Chords . . . . .	191	Other Licences. . . . .	225
Irregular Resolutions of the Suspension . . . . .	193	The Harmonizing of Embellished Melodies, and Basses . . . . .	231
Irregular Introduction of the Suspension . . . . .	197	Wandering Harmonies. Modulation with In- harmonic tones . . . . .	234
The Harmonizing of Melodies . . . . .	199	Warning Note . . . . .	239
Section 3. The Anticipation.		Analysis . . . . .	239
Hints and directions. . . . .	201		
Harmonic Anticipations. . . . .	202		
Syncopation . . . . .	203		

## PART V.

### VOCAL AND INSTRUMENTAL HARMONY WITH AN IRREGULAR 'NUMBER OF PARTS (FEWER OR MORE THAN FOUR). STYLE.

Section 1. Vocal Harmony.		Hints and Directions . . . . .	249
Three-part Harmony . . . . .	241	Melodic (or mixed) Figuration . . . . .	254
Two-part Harmony . . . . .	242	Two-part Figuration . . . . .	255
Five- to Eight-part Harmony. . . . .	244	One-part Figuration . . . . .	256
Section 2. Instrumental Harmony.		Irregular Part-writing . . . . .	258
Figuration or Broken Chords. Accompani- ments . . . . .	246	Figural Motives with Supplementary tones . . . . .	259
Harmonic Figuration . . . . .	246	Rhythmic Figuration . . . . .	260
The Registers of the Figural part . . . . .	247	Double, Compound and Complex Figuration . . . . .	262
		Triple and Quadruple Figuration . . . . .	263
		Paraphrasing; or simple Variation . . . . .	265

# PART I.

## DEFINITIONS AND RULES.

1. Music is the association of tones.

A tone is a fixed sound. The point in the domain of sound at which it is fixed is called its pitch.

Tones may be indicated in a number of ways. The oldest and most common way is to denote the tones by *letter*. For this purpose the first seven letters of the alphabet are used. This is all that is required, as the key contains only seven tones. Names for all other tones are obtained by inflecting these seven letters with accidentals (sharps and flats).

Tones are also indicated by *notes*, placed upon the staff. The identity of the tone (its letter-name) is fixed by a letter-sign, called the clef, placed upon some line of the staff.

Tones are also indicated by *numbers* indicating the vibratory rapidity which defines their pitch (e.g., middle C = 261 pulses in a second); and also by numbers indicating their place in the scale (as scale-steps).

---

The study of musical material embraces the consideration of the three essential factors of music: Rhythm, Melody and Harmony.

---

### RHYTHM.

2. Rhythm is engendered by the motion of the musical picture, and manifests itself in the association of differing time-values. It treats, first, of the division of the time required for the expression of a musical idea into absolutely regular and equal units, of which the most convenient and commonly adopted representative is the "beat." Secondly, rhythm treats of the grouping of a certain number of these units or beats in symmetrical measures. This grouping is effected by a regularly recurring emphasis, called the accent, always laid upon the first unit of each group.

The beats are absolutely similar in duration, but differ in quality, some being heavy and others light. This is the vital principle of rhythm, as it establishes a distinction between the beats, and gives the otherwise monotonous and meaningless series of similar strokes a recognizable form.

3. The rhythmic groups consist of either two or three units or beats, and constitute the simple measures of written music. When there are two beats in a group (heavy and light beats in regular alternation) the rhythm is **duple**:

When there are three beats in a group (an irregular alternation of one heavy and two light beats) the rhythm is **triple**:

a. The following are examples of *simple* groups or measures, in duple and triple rhythm:  $\frac{2}{4}$  (i.e., a group of two units of the value of quarter-notes);  $\frac{3}{8}$  (a group of three units of the value of eighth-notes);  $\frac{2}{3}$  or  $\frac{2}{4}$  (alla breve);  $\frac{2}{4}$ ;  $\frac{3}{2}$ , etc.

b. *Compound* measures are multiplications of these simple groups. For instance, two groups in duple time:  $\frac{3}{4} + \frac{3}{4} = \frac{6}{4}$  or  $\frac{3}{2}$ ; or  $\frac{3}{8} + \frac{3}{8} = \frac{6}{8}$ ;  $\frac{3}{8} + \frac{3}{8} + \frac{3}{8} = \frac{9}{8}$ ;  $\frac{3}{4} + \frac{3}{4} = \frac{6}{4}$  (not to be confounded with  $\frac{3}{2}$ ), etc.

c. Simple measures have only one accent; compound measures have an accent for each rhythmic group that they contain:

d. The only difference between simple and compound measure is, obviously, the number of bars.  $\frac{3}{4}$  measure is precisely the same as  $\frac{3}{2}$  with the alternate bars omitted.

The first accent of a compound measure is the strongest, as the exponent of the first of the two or three groups which compose the measure, and is called the primary accent; the other accent or accents are secondary.

e. Diversity of time-value is obtained by dividing beats, or by adding them together. The division of a quarter-note into two equal fractions gives eighth-notes; into three equal fractions, the triplet; into four fractions, sixteenth-notes. The addition of two quarter-notes gives a half-note. A dot lengthens a note one-half its time-value; and so on.

#### MODES OF ACCENTUATION.

4. The accent which falls upon the first unit of each group is called the natural or grammatical accent, and is fixed by counting. But an arbitrary stress may be imparted to any individual beat, for diversity of effect. These optional emphases are not "accents," but "accentuations," and may be produced as follows; 1st, *dynamically*, by simple emphasis; 2nd, *metrically*, by a tone of longer duration, representing the sum of two or more beats or fractions of beats; and 3rd, *harmonically*, by a change in the combination of tones. Thus:

5. Those rhythms are most natural and comprehensible, in which the dynamic and metric accentuations coincide with the *natural* accent, — that is, fall upon the first unit of a rhythmic group; if not constantly, at least for such a period and in such frequency as to render the rhythmic intention unmistakable. For example:

Measures *b*, *c*, *d*, are satisfactory in effect, because the longer notes coincide in position with the natural accent. This arrangement of time-values, — the heavier notes at the heavy beats, or the lighter notes at the lighter beats, — is therefore known as *regular* rhythm.

Measure *a*, consisting of uniform time-values, is regular, because there is no evidence of irregularity.

Measures *f*, *g*, *h*, *i*, are illustrations of *irregular* rhythm, because the arbitrary metric accentuations do not confirm the natural accents; that is, the heavier notes occupy lighter beats, or fractions. Such shifting of the natural rhythm is

generally known as syncopation, and it is extremely effective when recognizable as such. In order to be understood, it should appear in connection, or alternation, with sufficiently marked *regular* rhythm. See par. 390, 392.

Measure *e* is slightly irregular; the primary and secondary accents are exchanged.

### MELODY.

**6. Melody is any succession of single tones.** The quality of the melody depends upon the degree of congruity or affinity of the tones for one another; also upon the degree of uniformity in the grouping of the tones, both with regard to pitch and to time-values; also upon other, scarcely definable, conditions that do not concern the beginner. The fundamental requirement is, no doubt, that of *relation*; those tones which belong together will be most likely to sound well together.

**7.** A melody is a *line of tones*; a line whose successive points are fixed *sounds*, which define its flexions, its rising, falling, poising, in various rhythmic forms. Melody is therefore the same element in music that the line is in a picture or drawing of any character, simple or complex. These tone-lines determine all the tangible impressions imparted to an intelligent mind by the music; and they represent so nearly the sum of what is indicated by a musical sentence, that it may be said that the lines (that is, the melodies) *are* the music. With this conception of music, as a system of tone-lines, the student can not become too deeply impressed; for he must learn, sooner or later, that whatever he may desire to express in tones, must be conveyed through the *lines* of tone. He can assure himself of this by listening thoughtfully to any example of good music and analyzing his mental attitude, — observing what it is that gives him definite impressions of the music. Whether consciously or not, he will discover that he is tracing the tone-lines. It is this fact of musical formulation that gives to melody its supreme importance, and makes rhythm and harmony subservient.

### THE KEY.

**8. A key is a family of tones.** The term “family” is used advisedly, because it suggests a simple and exact analogy. The key is a group of related tones; tones which inevitably congregate, in obedience to the law of relation or affinity.

**9.** The vital principle of musical art is **Tone-relation**. Every association and progression is defined by it. A solitary tone has no more meaning than a single letter or character of speech has; both acquire significance only upon association with other characters, whereby a relationship is established, involving mutual obligations and actions.

**10.** The classification of the grades of tone-relation is not a matter of conjecture or opinion, but may be undertaken with mathematical exactness, because each tone represents a definite number, — the number which indicates the velocity of the tone-waves that fix the pitch of the tone.

**11.** The fullest degree of tone-relation is exhibited by two tones that have exactly the same velocity of vibration. This is the *unison*; the numbers, and therefore the pitch, are identical; the vibratory ratio is  $1 : 1$ , and it is quite impossible to distinguish the tones from one another by pitch.

The next, somewhat less complete, degree of relation is exhibited by two tones produced by a certain velocity and exactly double that velocity. This is the *octave*; the vibratory ratio is the simplest imaginable,  $1 : 2$ ; and though there is an actual difference in pitch, it is not entirely easy to distinguish the tones from one another. These tones are therefore regarded and treated in music as practically identical, as the same musical *factor* (in the chord, the key, — sometimes even in the tone-line), manifesting a distinction but not a difference.

The next, somewhat more remote, degree of relation is exhibited by two tones whose vibratory velocities represent the next simplest ratio,  $1 : 3$ , or  $2 : 3$ . This is the so-called *perfect fifth*. There is not only a difference in pitch, but it is easy to distinguish the tones from one another, — in fact, not possible to confound them. The personality of each is complete, the result is two *actually distinct factors*, which, nevertheless, constitute the *most intimate affinity* that can exist between actually different tones.

12. It is with this significant tone-relation, the perfect fifth (to which the name *harmonic degree* might be given), that nature initiates the entire system of tone-combination. The unison and octave are used for duplication and extension into higher or lower registers, but the perfect fifth is the basis of generation. It is the necessary simple point of departure for every association and every action in the domain of tone; from it radiates the whole tone-complex, like a web, ramifying and extending infinitely. It is this interval which determines the tones that must assimilate and congregate (in a sense, gather as a clan) in the group or family of tones called a key.

The perfect fifth may be located on the keyboard by counting upward eight "keys," or half-steps; thus from *c*: *c-c#-d-d#-e-f-f#-g*. The upper tone must, moreover, be the fifth letter from that of the lower tone. Thus, *A<sup>b</sup>-E<sup>b</sup>* (not *D#*); *B-F#* (not *G<sup>b</sup>*).

13. The key or family of C (for example) is formed by beginning with C (as head of the family) and defining his two nearest relatives, — the perfect fifth both upward and downward, — the tones G and F. The process of tone-generation operates upward, and therefore the next member of the family will be the perfect fifth upward from G, — the tone D. (The lower perfect fifth of G confirms the keynote C). The next member is the upper fifth of D, the tone A; then its fifth, the tone E; then the fifth of the latter, the tone B. The following perfect fifth, the related tone of B, is F-sharp.

There is no particular reason why this tone should not be a member of the family of C, excepting that it conflicts sharply with the F-natural, whose relation to the keynote C is too intimate to be overpowered by the remote relative, F-sharp. The observant student is surely aware that this F-sharp, while not a legitimate *member*, is nevertheless a very frequent *guest* in the family of C.

Excluding the F-sharp, because of its hostility to the closely related F-natural, this key will be found to contain the following seven tones:

Ex. 6.

Keynote

or

not a member of C

F C G D A E B (F#)

Detailed description: The example shows a musical staff with a treble clef. The notes are F (below the staff), C (middle C), G, D, A, E, and B (with a sharp sign). The notes are connected by a series of perfect fifth intervals. The F# note is marked with a sharp sign and a note head above the staff. The text 'Keynote' is above the C note, and 'or' is above the B note. The text 'not a member of C' is below the B note. The notes are labeled with letters below the staff: F, C, G, D, A, E, B, and (F#).

14. The nucleus of the key is formed by the five relatives, C, G, D, A, E, — five contiguous tones in the chain of perfect fifths. In this nucleus the lowermost tone is the keynote. Any combination of these five tones results either in consonance, or the mildest dissonance (whole step; for example, C and D together); nowhere does a harsh dissonance appear. These are the five tones of the most common 5-tone scale (the Scotch scale, for instance).

These nucleus-tones are the ones used by **Beethoven** in the first period of the theme of his "Leonore" overture (probably with singularly true musical instinct):

C-G-D-A-E

Ex. 7.

Detailed description: The example shows a musical staff with a treble clef. The notes are C, G, D, A, and E, connected by a series of perfect fifth intervals. The notes are labeled with letters below the staff: C, G, D, A, E.

To these five nucleus-tones a perfect fifth is added at each end (F below the C, and B above the E). These additional tones result, by combination with the others, in the more harsh dissonance of the diatonic half-step (F-E, and C-B), and beyond this the "family," as a body of reasonably harmonious members, apparently can not extend. Hence the limitation of a key to seven members, as shown in Ex. 6.

15. Any tone may be adopted as keynote, and the members of its key or tone-family found, as above, by adding one perfect fifth below, and five successive perfect fifths above. Thus, for the key of A $\flat$ : — A $\flat$ —D $\flat$ —E $\flat$ —B $\flat$ —F—C—G. For the key of E: — E—A—B—F $\sharp$ —C $\sharp$ —G $\sharp$ —D $\sharp$ .

All keys have the same series of seven letters, beginning at different points. For the key of C it is the established custom to use *plain* letters; all the other keys require the inflection of one or more of the letters (by sharps or flats), and the number of such inflections defines the signature of the key. In the key of A $\flat$ , for instance (see above), four letters are flatted, therefore the signature of A $\flat$  is four flats. In the key of E four letters are sharped, hence its signature is four sharps.

THE SCALE.

16. a. A scale is any succession of whole steps and half-steps.

b. The whole step, as seen, is the difference in pitch between tones of the key which lie two harmonic degrees (perf. fifths) apart, — reduced by the octave to closer proximity; Ex. 8a. The diatonic half-step is the difference in pitch between tones that lie five harmonic degrees apart; Ex. 8b. The chromatic half-step is seven harmonic degrees removed; Ex. 8c.

Ex. 8. a. Whole step      b. Diat. half-step      c. Chrom. half-step

c. 2 deg. d.      f 5 deg. e.      f. 7 deg. f $\sharp$

(The term *diatonic* refers to the scale, and means “agreeing with the scale.” The term *chromatic* refers to the inflection of a scale-step by an accidental.)

17. There are therefore as many possible scales as there are possible combinations of the whole and half-steps. But of all these varieties, there is only one scale that is *natural* (that has its origin in a *natural* arrangement of tones), and that is the so-called **major scale**.

18. The major scale is not “constructed,” but is derived from a natural source, — from the key or original tone-family. **The major scale consists of the seven tones of the key, arranged in progressive pitches;** that is, reduced by the octave to successive close proximity. Thus (C major):

C major, as key or tone-family      or, closer together      As C major scale

Ex. 9. F C G D A E B    F C G D A E B    C D E F G A B (C D E etc.)

19. When thus defined, by direct derivation from the key, the natural (or major) scale is found to represent the following succession of whole and half-steps: whole steps between scale-steps 1-2, 2-3, 4-5, 5-6, 6-7; half-steps between scale-steps 3-4, 7-8. Thus:

Ex. 10. Scale-steps 1 2 3 4 5 6 7 8

1 1 1/2 1 1 1 1/2

The reason for this apparently inexplicable arrangement of steps is in reality very simple: — the tones simply assume these pitch-spaces when the original key-members are thus reduced to scale-form; it is not devised as a scale, but “comes out that way” by agreement with the tone-family. No further demonstration need be sought.

20. The scale-tones are called steps, or, rather, *scale-steps*; and are numbered upward from the keynote. Their names are as follows:

a. The *first*, and most important, step is called the *Tonic* (or keynote);

The next in importance is the *fifth* scale-step (the perfect-fifth derivative from the tonic), called the *Dominant*;

The next in importance is the perfect fifth below the keynote, the *fourth* scale-step, called the *Subdominant*. These three tones, tonic, dominant and subdominant, are the *principal members* of the key and scale. The rest are subordinate, and their names, in the order of importance, are as follows:

b. The *second* scale-step is the perfect-fifth relative of the dominant; in a sense, “the dominant of the dominant,” — wherefore it is called the *Second-dominant*;

The *sixth* scale-step lies midway between the tonic and subdominant, and is therefore called the *Submediant*;

The *third* scale-step lies midway between tonic and dominant, and is called the *Mediant*;

The *seventh* scale-step is called the *Leading-tone*.

Ex. 11. C major.

1 5 4 2 6 3 7

#### REVIEW OF FUNDAMENTAL PRINCIPLES.

Rhythm is diversity of time-values, and of dynamic force.

There are only two species of beat-groups: duple and triple.

Rhythm is regular when the heavier (longer) notes appear on the heavier pulses, and vice versa.

Melody is a succession of single tones, a tone-line; and the most significant element in music.

A key is a family of seven tones, associated in harmonic degrees (perfect fifths).

The only true, natural, scale is the so-called major scale, which is derived from the key by placing the tones in progressive pitches.

The principal tones of a scale or key are the tonic, dominant and subdominant.

#### EXERCISE ONE.

a. Write out every key in its original form, as in Ex. 6.

b. Write out every major scale, first as in Ex. 10; then as in Ex. 11, attaching the name to each scale-step.

#### RULES OF MELODY.

21. It may seem impossible to establish definite rules for the mechanical invention of a melody, because this pre-eminent musical element is the mysterious product of many and varied natural principles, whose subtle interactions must be perceived by instinct rather than by reason. Nevertheless, there certainly are general laws and rules of melodic movement which can and must be learned. As stated in par. 6 (which review), the most vital requirement is that of *relation*. Hence the first rules of good melodic conduct:

- 22. a. A melody may follow the line of a Scale. And:
- b. A melody may follow the line of any good (important) Chord.

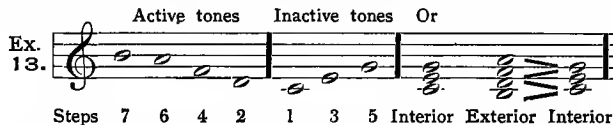

(The scale is explained in par. 18; for the definition of the chord, see par. 43, 47. All of the rules of melody will be found in thorough detail in the author's *Exercises in Melody Writing*.)

For example:

Ex. 12. 

23. There are, however, some limitations to each of these rules. In following the scale-line, it is necessary to consider the natural inclination of certain scale-steps to rise or fall. These tendencies are partly inherent in the relations of the several scale-steps to their keynote, and are partly due to impulses acquired through association with other tones. The former (natural) tendencies are defined as follows:

24. a. The seven tones of the scale or key may be divided into two classes: into **Active tones**, which possess a pronounced inclination to proceed in a certain direction; and **Inactive tones**, which possess no melodic tendencies themselves, but represent the aim and fulfillment of the tendencies of the others.

Ex. 13. 

b. The inactive tones are those which form the chord of the key, or which are generated (as "overtones") out of the keynote, and which therefore share with it the attribute of *rest* which distinguishes the keynote from all the other tones of the key. The inactive tones lie, so to speak, at the center of harmonic repose.

c. The active tones are the other four scale-steps, which lie *outside* of this harmonic center, and therefore tend, more or less urgently, to regain the condition of repose. They thus simply respond to the same law of gravity which governs the swinging, and final stopping, of a pendulum.

d. The direction of each active scale-step is determined by its proximity to an inactive tone, being most strongly attracted by that inactive tone to which it lies nearest. Thus:

- The 7th scale-step *ascends* (preferably one step, to the 8th);
- The 6th scale-step *descends* (preferably one step, to the 5th);
- The 4th scale-step *descends* (preferably one step, to the 3rd).

The 2nd scale-step is unquestionably active, but, lying as it does equally distant from the inactive first and third scale-steps, the *direction* of its movement is not positively definable. For illustration:

Ex. 14. 

This rule is illustrated in the following examples:

Ex. 15. 

*d.* *Star-spangled Banner*

*e.* *Die Wacht am Rhein*

30. The narrow leap involves no obligation. But after a *wide* leap (beyond a third: see Ex. 21), the melody usually turns. This is almost imperative when the leap is made to an active tone, less so when made to an inactive scale-step. Also, it is not necessary when the melody continues in the same chord-line (par. 28). For example:

Ex. 19.

31. If the wide leap is made to an active tone in the direction of its natural tendency, it is impossible to turn without violating this tendency. Hence the rule, that a wide leap to an active tone should be made in the direction contrary to its tendency; that is, *down* to scale-step 7, and *up* to scale-steps 6 and 4. (Always excepting when the chord-line is unchanged.)

Ex. 20.

Test these rules by examining the given melodies in the book, — Exercise 16, etc.

#### FUNDAMENTAL PRINCIPLES.

A melody may follow the scale-line, and a good chord-line.

The natural tendency of scale-step 7 is to ascend; of scale-steps 6 and 4 to descend.

The natural tendency of an active tone may be overcome by approaching it along the scale in the other direction.

Successive skips in the same direction should be made along the same chord-line.

After a wide leap, the melody usually turns.

A wide leap to an active tone is best made in the direction opposite to its tendency.

#### EXERCISE TWO.

First study par. 43, 44, 51. Then write a large number of melodic sentences, either 4 or 8 measures in length, with strict observance of the above rules, and imitating the style of the given melodies (Exercises 16, 17, 22, etc.).

## HARMONY.

32. Harmony, in its narrower sense, is the combination of single tones; in its wider sense, the association and succession of such harmonic bodies.

33. The combination of any two tones constitutes an Interval.

The term interval, or "space," may obviously not be applied to *tones*, as tone-associations are not defined by *distance*, but by *relation* only. The word "interval" does, however, apply to the *notes*, which lie upon the staff (and in the scale) at varying distances from one another. The names of these spaces, — between the *notes on the staff*, — are simply adopted as names for the various tone-associations, or synonyms of the tone-relations.

## INTERVALS.

34. Intervals are always counted from the lower note upward, *as the major scale goes*, and are determined by the number of steps of the scale included by the two notes.

prime  
or  
unison      second      third      fourth      fifth      sixth      seventh      eighth  
or  
octave      ninth      tenth      etc.

Ex. 21.

The first eight are simple intervals; the last two and all that follow (beyond an octave) are compound, — consisting of an octave and a second, octave and third, etc. Such intervals are always reduced to simple ones, and called, with omission of the octave, simply "second," "third," etc.; for, as already observed, these terms indicate strictly the relationship between the *letters*, which is always the same without regard to distance, as long as the letters do not exchange places. Thus, C-D is a "second," whether written

or : and even D-C is but slightly different.

35. These intervals, which follow the major scale, and therefore represent the simple *scale-relations* of the several steps to their keynote, may be called natural or diatonic intervals. They are divided into two classes: *perfect* and *major*. The **unison, fourth, fifth and octave**, *from the keynote of any major scale*, are called **perfect**.

The **second, third, sixth, and seventh** from the keynote are called **major**.

C major.      8ve      b. Major.      6th      7th

a. Perfect.      2nd      3rd

Ex. 22.

That is to say, the interval *c-f* (for instance) is a *fourth*, because *f* is the 4th letter or step in the scale of C; and it is a *perfect* fourth, because it exactly agrees with the natural scale of C, and because "perfect" is the term used to qualify the natural or diatonic 4th. The interval *e-c#* would be counted along the scale of E, and, as *c#* is the 6th letter from *e*, it is a *sixth*; furthermore, a *major* 6th, because it exactly agrees with the scale of E, and because "major" is the term applied to the natural sixth.

36. A *perfect* interval, when extended by an accidental ( $\sharp \times$ ), the letters remaining the same, becomes *augmented*; when contracted by an accidental ( $\flat \flat$ ), it becomes *diminished*. For example:

Perfect 5th    Augmented 5th    Diminished 5th

Ex. 23.

It is obvious that if the *letter* were to be changed, the *quantity* of the interval would be altered. Therefore the  $g\sharp$  (Ex. 23) must not be regarded as equivalent to  $a\flat$ , nor  $g\flat$  to  $f\sharp$ .

37. The perfect intervals are so called because they represent the best (most nearly "perfect") *relations*, — the associations of the keynote with its dominant and subdominant, the three principal tones of the key (par. 20). Ex. 22a. The associations of the keynote with the other scale-steps are less perfect ("imperfect") relations, and to these the term *major* (the "greater") is given, because they represent the larger of two sizes that are constantly being assumed by what is practically the same relation.

The "smaller" of these sizes is called *minor*, and it is obtained by contracting the major interval by an accidental. There are therefore four minor intervals, derived from the four major ones (Ex. 22 b).

Maj. 2nd    Min. 2nd    3rds    6ths    7ths

Ex. 24.

Maj.    Min.    Maj.    Min.    Maj.    Min.

As stated, the major and minor sizes represent practically the same *relation*. That is, there is no radical difference between major and minor; none that affects their treatment as musical factors. They are merely different aspects of the same *tone-relation*. But, on the other hand, the inflection of any interval into its augmented or diminished form does result in a radical difference, both in relation and treatment.

38. A *major* interval, when extended by an accidental, becomes *augmented*, precisely like the perfect intervals. When contracted it becomes, as has been seen, not diminished, but *minor*.

A *minor* interval, when contracted, becomes *diminished*. Thus:

Major 3rd    Augm. 3rd    Minor 3rd    Dimin. 3rd

Ex. 25.

From this it appears that the perfect intervals become diminished by *one* contraction, whereas the major intervals must be contracted *twice* to become diminished.

39. In defining the quantity and quality of a given interval, the student must start from the only infallible standard, the *major scale*, and erect it upon the lower of the two notes. The number of the upper note in the scale gives the quantity. If the upper note agrees with the scale in question, the interval will be either perfect or major (par. 35). If not, it will have become minor, augmented or diminished, according to the inflection that has taken place (par. 36, 38). This, and a few other conditions, are shown in the following example:

Ex. 26.

G maj. scale    Db maj. scale

At *a*, the interval is a 5th in quantity; the scale-note *d* being changed to  $d\sharp$ , the natural "perfect" 5th has been extended to an augmented 5th. At *b*, quantity, a 7th; being altered from *c* to  $c\flat$ , the natural "major" 7th has been contracted to a minor 7th.

In cases like *c*, where the major scale of the lower tone is unfamiliar and inconvenient, the simplest process is to shift the interval to a convenient place by cancelling an equivalent accidental from both notes.

At *d*: This somewhat rare interval would be called a "double-augmented" 4th.

At *e*: Instead of the contradictory "diminished prime" ( $g-g\flat$ ), one should designate its equivalent, the "diminished octave."

## EXERCISE THREE.

A. Erect the dimin. octave, minor second, dimin. third, perfect fourth, augm. fifth, minor sixth, and dimin. seventh,	} upon each of the notes	{ E, A, D, G, B, F $\sharp$ , C, G $\sharp$ , F, C $\sharp$ , D $\sharp$ , and B $\flat$ :	} and the augm. octave major second, minor third, dimin. fourth, perfect fifth, augm. sixth, and min. seventh,	} on the notes	{ D $\flat$ , G, C, F, B $\flat$ A $\flat$ D, E $\flat$ , G $\flat$ ,
---	-----------------------------	--	---	-------------------	---

B. And determine the names of the following intervals:

## CONSONANCE AND DISSONANCE.

40. Besides the relation of *generation* (explained in par. 11), which determines the right of the tones to associate as independent factors, in their operations within a key, there is another quality of tone-relation or affinity known as *consonance*. This refers to the degree in which the tones blend with each other, as sounds, and determines their right to appear in simultaneous union. (All the tones of a key are related by generation to their tonic, but if all sounded together at once there would be a disagreeable excess of dissonance; so it is evident that the first relation does not fully guarantee the other.)

41. The distinction of consonance and dissonance is defined by the vibratory ratio of the sound-waves which produce the sensation of tone.

*a.* It has been seen that the ratio 1 : 2 gives the octave, and 2 : 3 the perfect fifth (or harmonic degree). The next ratio, 3 : 4, gives the perfect fourth. Then follow 4 : 5 — the major third; 5 : 6 — the minor third.

*b.* Thus, as the tones approach each other in pitch, the ratios become more complex; there is a gradual increase of conflict between the sound-waves, resulting in proportionate decrease in consonance, or tone-blending. The ratio 8 : 9 gives the major second (or whole step), and 15 : 16 gives the minor second (or diatonic half-step).

*c.* In musical theory, the ratios up to 5 : 6 produce consonances; those which follow produce dissonance. Therefore, the *minor third is the smallest consonant interval*.

*d.* The consonances are divided into two classes, however, because of the appreciable difference in their degrees of blending. The octave and fifth (direct and inverted, — par. 42) are called perfect consonances; the others (thirds and sixths, both major and minor), are called imperfect consonances.

*e.* All seconds and sevenths, and all augmented and diminished intervals, are dissonances.

42. The *inversion* of an interval is its complement within an octave. Thus:

8ve 7th 6th 5th 4th 3rd 2nd Unison  
 Unison 2nd 3rd 4th 5th 6th 7th 8ve

In the inversions, one tone is simply transferred past the other to a higher or lower octave, therefore (on the grounds of par. 11) an interval and its inversion are *practically identical*. A perfect interval when inverted remains perfect; the inversion of major becomes minor; the inversion of augmented becomes diminished.

CHORDS.

43. A chord is the combination of *more than two tones*, so chosen that the intervals are entirely or preponderantly consonances (par. 41d).

The English word "chord," possibly owing to a confusion of derivation, has the same meaning as the word "accord" ("Akkord," "accordo") used in continental Europe, and signifies a body of tones which *accord* with each other.

44. Consonant chords, or *concord*s, containing none but consonant intervals, can not embrace more than *three tones*, combined as follows:

(E♭ may be substituted for E, and A♭ for A, because the intervals 3 and 6 may be either major or minor. The intervals 5 and 4 must, however, be *perfect* to be consonant.) The forms at *d*, *e*, and *f*, are identical with *a*, *b*, and *c*, respectively. The forms *b*, and *c*, are merely modifications of the first and natural form *a*, by *inversion*. For illustration:

From which it appears that Ex. 28*a*, in which the tones lie one above another in thirds, is the primary chord-form, from which all others are derived.

45. *a*. If another third be added (the ear sanctions *b♭* in preference to *b♮*) the new tone forms a dissonant interval (7th) with the lowest.

*b*. If still another third be added there will be three dissonant intervals.

46. *a*. Chords like these, which contain one or more dissonances, are called dissonant chords, or *discords*. Their use in harmony is not only sanctioned but demanded; because, on account of the obligations associated with a dissonance, they are more active than consonant chords. And, besides, their slight harshness affords a necessary contrast to the purer but less attractive concords.

*b*. Still, the dissonant intervals must be introduced in judicious proportion to the consonances, which must largely predominate. The addition of still another third to the above chords would increase the number of dissonances to such an extent (as shown by the lines) that there would barely be a predominance of consonant intervals.

c. To such tone-combinations as these, which extend beyond 5 tones and contain an undue proportion of dissonances, and to such tone-bodies as do not conform to the structure of thirds (for example , a place is assigned among the so-called **Inharmonic elements**, where they can be much more simply and satisfactorily analyzed.

47. The concise definition of a "chord" is, then, a combination of three, four or five tones, in intervals of thirds (or reducible to such).

48. A chord of three tones is called a **Triad** (usually a *concord*); a chord of four tones is called a **Chord of the Seventh** (*discord*); and a chord of five tones is called a **Chord of the Ninth** (*double-discord*).

Ex. 30.

Triad                  Chord of the 7th                  Chord of the 9th

49. The tones which constitute a chord are called, separately, the **Intervals of the chord** (or **chord-intervals**), the term "interval" here again signifying the harmonic *relationship* of the upper tones to the lowest.

The lowest chord-interval (the one upon which the structure of thirds is erected, and from which the whole chord emanates) is called the **Root**. The other tones are called the **chord-third**, **chord-5th**, **chord-7th**, and **chord-9th**, respectively, according to their distance from the root.

Ex. 31.

Fifth                  Ninth  
Third                  Seventh  
Root                  Root

50. A major third and perfect fifth constitute a *major triad*; a minor third and perfect fifth, a *minor triad*. The *augmented triad* has an augmented 5th and a major 3rd; the *diminished triad*, a diminished 5th and minor 3rd.

Ex. 32.

Major triad                  Minor triad                  Augm. triad                  Dim. triad

There are a few other distinctions made in the species of triads, and the varieties of four- and five-tone chords reach a high number. But as it is not the *shape* and *sound* of a chord, but its *location in the scale* and consequent *relation to its tonic* which defines its treatment, no further attention need be paid to these distinctions.

51. A triad may be erected upon each tone of the diatonic scale, *excepting the leading-tone*, and each triad takes its name from the step of the scale which its *root* occupies.

Ex. 33.

C-major

<p>Tonic Dominant Subdominant</p>	}	triads, or <b>Principal triads</b> .
<p>Second-Dom. Submediant Mediant</p>	}	triads, or <b>Subordinate triads</b> .

The first three are **principal**, because they emanate from the principal tones of the scale (par. 20 a), *i.e.*, the tonic or keynote itself, and those other two tones which stand in the relation of the harmonic degree (perfect fifth) to the tonic. These are the fundamental harmonies of a key, and, being *major* triads, they characterize and give the name "major" to their key. The last three are **subordinate**, because they lie more remote from their tonic; and, being *minor* triads, they contradict and oppose the prevalent major character of their key, and can therefore appear only as subservient and contrasting elements.

52. For convenience, the triads are designated by Roman numerals, coinciding with the situation of their roots in the diatonic scale, as follows:

Ex. 34. Musical notation showing six triads labeled I through VI on a staff. The triads are: I (C major), II (D minor), III (E minor), IV (F major), V (G major), and VI (A minor).

Spoken: "the One," "the Two," "the Three," etc.

53. The triad upon the leading-tone must be set aside for the present, for reasons which will appear in due time.

FUNDAMENTAL PRINCIPLES.

- Intervals which agree with the scale-steps are perfect or major.
- There is no radical difference between major and minor intervals.
- An interval and its inversion are practically identical.
- A chord is the combination of from three to five thirds.
- The leading-tone cannot be a root.

EXERCISE FOUR.

Write out the six triads of every major key in the order given in Ex. 33, attaching the name, in Roman numerals, to each.

THE VOICES OR PARTS.

54. Music of every description is based upon the *succession of chords*, in such harmonic order as the various tone-relations (and the melody) dictate, and in such metrical order as the character of the piece requires, or the fancy of the composer suggests. For the adequate expression of such a succession of chords, four distinct tone-lines, called *voices* or (especially in instrumental music) *parts*, are necessary, and are usually employed.

a. Chords of three tones furnish material for but *three parts*, it is true, but it is advantageous to duplicate one of these three tones, in order to define the chord and the key with greater distinctness, and for this duplication a fourth part is required. And, on the other hand, chords of five notes, being somewhat unwieldy, are almost always deprived of one unimportant interval, so that even for such chords four parts are sufficient.

55. These four voices or parts are called (from the lowest upward) **Bass**, **Tenor**, **Alto** and **Soprano**. As *vocal* parts they have the following average compass:

Ex. 35. Musical notation showing the average compass for four voices: Bass, Tenor, Alto, and Soprano. The Bass part is in the bass clef, Tenor in the bass clef, Alto in the treble clef, and Soprano in the treble clef. The notes shown are G and C for each part, with the Bass part starting on a lower G.

56. The female voices (soprano and alto) correspond respectively in compass to the male voices (tenor and bass), but differ just about an octave in register. The highest and lowest of each class (soprano and tenor — alto and bass) are therefore called *parallel parts*. The compass here given is a safe *average*, and is bounded, as will be observed, by the tonic and dominant of C.

In instrumental music the compass of the parts depends entirely upon the instrument employed; for pianoforte music the compass is almost unlimited, and the terms soprano, alto, tenor, bass, refer merely to the relative position of the different parts, the highest being always "soprano," the lowest always "bass," etc.

The parts are usually written upon two staves, the female voices in the G-clef, the male voices in the F-clef; and the stems of the notes are turned respectively upward and downward to distinguish the parts which occupy the same staff,—as shown in Ex. 36.

57. The most important of these four tone-lines is, generally speaking, the soprano, as its tones are more prominent than those of the lower lines, and it therefore *generally* carries the "melody" proper, the air or tune of the sentence.

The next in importance is the bass line, as it defines the chords, and supplies the harmonic basis of the composition.

The two inner parts are comparatively unimportant, as individual lines; they accompany the outer parts, and complete the harmony.

The arrangement and progression of the four parts or melody-lines which co-operate in the expression of a musical thought, are illustrated in the following example:

Melody

Ex. 36.

58. *Rule I:* The parts should not cross (e.g., the soprano line should not be carried below the alto; and the same with the other parts).

*Rule II:* The *alto* should not lie *more than an octave* from either of its two neighbors, soprano and tenor. For example:

good

Ex. 37.

#### DUPLICATION OF CHORD-INTERVALS.

59. The best notes to double are *the principal tones of the scale* (the tonic, dominant and subdominant), *wherever they occur*; — excepting, first, when they are the *chord-fifth* in a triad, which interval is not entitled to the prominence which duplication gives to a tone; and, second, when they represent a dissonant interval (par. 200d).

By thus emphasizing the chief elements of the scale, the identity of the key is maintained throughout in the most consistent manner. The result is as follows:

Ex. 38.

I   V   IV            II   VI   III            I   IV   II

60. From this it appears that

in the *principal* triads the root (Ex. 38a), and

in the *subordinate* triads the **chord-third** (Ex. 38b),

should be duplicated, as a general rule.

As seen in Ex. 38c, the chord-fifth of the I, and also of the IV, are principal tones of the scale. But they should nevertheless not be doubled, because of their quality as *chord-fifth*. In subordinate triads the chord-fifth is a subordinate scale-step, and therefore its duplication is still more questionable. Also, for the same reason, the *chord-third* of a principal triad should not be doubled, as a rule (Ex. 38d).

61. There are two additional, exceptional possibilities, as follows:

a. In the subordinate triads the root may be doubled (though a subordinate tone of the scale), because it is the principal interval of the chord. (Ex. 39a.)

b. In the *principal* triads the chord-fifth may be omitted, and the root tripled. (Ex. 39b.)

Ex. 39.

II                    VI   III            I   V   IV            II

THE POSITIONS OF A CHORD.

62. In view of the prominence and significance of the uppermost tones (par. 57), it is evident that much must depend upon the choice of chord-interval assigned to the soprano part. This choice, which also defines the principal *melodic* line, determines the so-called *position* of the chord, as follows:

a. When the root is in the soprano, the chord is in *octave-position*. "Octave" is here synonymous with "root," and applies to the root in any part above the bass.

b. When the chord-third is in the soprano, the chord is in the *position of the third* (not "third-position").

c. When the chord-fifth is in the soprano, the chord is in the *position of the fifth*. Thus:

Ex. 40.

	Position of the 3ve	Position of the 3rd	Position of the 5th
SOPRANO.	8 Octave (Root)	3 3rd	5 5th
ALTO.	3rd	5th	3rd
TENOR.	5th	Octave (Root)	Octave
BASS.	Root	Root	Root
	I	I	I

## FUNDAMENTAL PRINCIPLES.

The principal tones of the key should be doubled, as a rule.  
 Any root may be doubled.  
 The chord-fifth, in principal triads, may be omitted; but not doubled.  
 The "position" of a chord is defined by the soprano.

## EXERCISE FIVE.

Erect the six triads of G major in successive order (I, II, III, IV, V, VI), in their three positions, according to the following model:

Octave-position      Position of the 3rd      Pos. of the 5th

C major I      good 61b      I      I      II      60      61a

The root must always be in bass. Strict regard must be paid to the compass of the parts (Ex. 35), and to the duplication of Intervals (par. 60, 61). The following examples are wrong:

58, Rule 2      Ex. 38d      Ex. 38c      Ex. 35

## RULES OF PART-WRITING.

**63.** The conduct of the four voices or parts, the tracing of the four tone-lines which co-operate in the combination of harmonic bodies, is guided by the following four fundamental laws of voice-progression:

**64. Rule I.** *a.* Each part should move as evenly, connectedly, (diatonically, "horizontally") from one chord-interval to another as circumstances will permit.

*b.* Wide leaps should be avoided as much as possible.

*c.* A tone that is common to successive chords *generally* remains unchanged.

*d.* This rule applies chiefly to the inner parts. Both soprano and bass may be treated with more freedom.

For example:

Ex. 41.

N.B. Each of these measures is an example by itself, and is not to be connected with the one that follows.

**65. Rule II. a.** No two parts (neither outer, inner, adjacent nor parallel parts) should move in *parallel motion* (i.e., direction) from *one perfect fifth to another perfect fifth*; nor from *one perfect octave, or unison, to another perfect octave, or unison*. In other words, *parallel or consecutive fifths, octaves and unisons, in the same pair of voices, are prohibited*.

b. Successive chord-fifths sound disagreeable because of the comparatively unpleasant *sound* of the interval of a perfect fifth. The ear accepts one of these at a time (especially when softened by the presence of a third), but rejects two in close and evident succession. As will be seen, the effect of even one fifth alone, when rendered conspicuous by any means, may be decidedly unwelcome; and inversely, whatever serves to conceal or disguise the fifth, proportionately removes the objection.

c. Successive octaves do not offend the ear; but when two distinct parts make the selfsame movement at the same time, the individuality of each part is momentarily lost. In successive unisons, one part disappears entirely. *Persistent successive octaves, on the contrary, which duplicate an entire melodic figure or line, do not convey this disappointing impression, and are therefore good, — the intention being obvious.*

d. Consecutive seconds and sevenths are forbidden by common sense, and are therefore not included in the rule. Consecutive fourths are as disagreeable as fifths, but apparently less distinct; they seldom occur alone, and whatever accompanies them generally overpowers them.

Ex. 42. Parallel motion in

2nds      3rds      4ths      5ths      6ths      7ths      8ths

good      conditional      good      conditional

Parallel or consecutive fifths and octaves:

Ex. 43.

The student will recognize which parts are represented in this example, by the direction in which the stems are turned. The other parts are purposely omitted.

**66. Rule III.** The parts (or, more exactly, any *two* parts) should be led as much as possible in *parallel thirds or sixths*, as progressions of this kind invariably sound well.

See Ex. 42, measures 2 and 5.

Ex. 44.

Andante.

BACH  
etc.

This applies to single progressions as well as to a protracted series of chords, and is applicable to *any* pair of parts, — not necessarily adjacent ones.

**67. Rule IV. a.** *The leading-tone must progress diatonically upward to the tonic, in whichever part it chances to lie; but especially in prominent parts (soprano or bass). Par. 24d.*

*b.* The *downward* tendencies of the 6th and 4th steps of the scale must also be respected, *in prominent parts.* Par. 24d. (But see par. 26.)

*c.* The leading-tone should never be doubled.

#### THE GENERAL EXCEPTION.

**68.** These rules of harmonic progression refer only to the *transition from one chord into another (new) one*, and are not valid for the mere *repetition*, or change of form, of the *same chord*.

Hence, when a chord is simply repeated, it is possible, and even desirable, to change the location and arrangement of the tones, even with wide skips (contrary to Rule I), in order to avoid monotony. Thus,

Ex. 45.

is preferable to

On the ground of this exception, the *repetition* of a fifth, octave or unison is permissible; Ex. 46a. Further, the leading-tone may make any reasonable leap, in either direction, during chord-repetition; Ex. 46b. And, similarly, the tendencies of all other active tones are suspended as long as the chord remains the same; Ex. 46c.

Ex. 46.

V                      I                      IV                      II

FUNDAMENTAL PRINCIPLES.

- The voices must move smoothly; without wide leaps, if possible.
- Parallel 5ths or 8ves in the same pair of parts are forbidden.
- Parallel 3rds and 6ths are very desirable.
- The leading-tone must not be doubled; and it ascends to the tonic.
- During the repetition of a chord, all rules are suspended.

QUALIFICATIONS OF TONES, CHORDS AND CHORD-INTERVALS.

69. The manifest difference in the quality and importance of the various tones, chords and chord-intervals may be briefly defined as follows:

a. The relative quality and importance of a tone is determined by its distance from the all-important tonic in harmonic degrees (perfect fifths). This indicates the extent to which it confirms the key. The relative order of scale-steps is therefore 1, 5,  $\frac{4}{2}$ , 6, 3, 7. (Steps 5 and 4 are theoretically of equal importance, as each lies one harmonic degree from the keynote; but preference is always given to the upper perfect fifth, which is literally next of kin.) Steps 4 and 2 may be considered practically equal; therefore "subdominant" and "second-dominant" are nearly synonymous.

b. Exactly the same arrangement obtains in the grading of the chords, the order of which is: I, V, IV, II, VI, III. (As intimated in par. 53, there is no "VII.")

c. The quality of a chord-interval is determined by its distance, in ascending thirds, from its root. The root, as exponent of the chord, is the strongest. The chord-third is lighter and more flexible, — in some respects the best part of the chord for the practices of composition. The chord-fifth is still lighter; it is weak, hollow, "soft," and, as shown, may be omitted at times. In par. 65, this quality is given as a reason for avoiding successive fifths. ("Chord-fifth," and perfect fifth as "harmonic degree," must not be confounded.)

d. The chord-seventh and chord-ninth are still weaker and more unstable. But, as *dissonances*, they possess a certain piquancy which the chord-fifth lacks.

70. The entire system of tone-material is grouped in three distinct classes: the tonic class, the dominant class, and the second-dominant (or subdominant) class. There are points of resemblance between them, and yet each forms a distinct system by itself. These three classes cover the whole ground of musical associations and movements. There is no chord that ever has been, or can be, used, that may not be defined as a member of either the tonic, the dominant, or the second-dominant class of harmonies. The tonic class is peculiar to itself. In this book the dominant chords will be called the *first class* (of non-tonic chords); those of the second- or sub-dominant will be called the *second class* (of non-tonic chords). Comp. Ex. 147.

b. From the position of the *third* of the I:

Ex. 48.

Musical score for Example 48, showing two staves (Soprano and Bass) with various annotations including fingerings (3, 5, 3, 5), accidentals (\*6), and circled symbols (⊕, ⊗).

c. From the position of the *fifth* of the I:

Ex. 49.

Musical score for Example 49, showing two staves (Soprano and Bass) with various annotations including fingerings (5, 3), accidentals (\*2, \*4), and circled symbols (⊕, ⊗).

\*1) Par. 64c. — \*2) Par. 65. — \*3) This measure illustrates a noteworthy exception to the rule of successive octaves; they appear in soprano and bass, but in *contrary direction*; at \*4) successive fifths occur, similarly, in opposite direction. In the case of octaves, the difference in direction is a sufficient excuse, even in prominent parts; but successive *fifths* are not excused by opposite motion, unless one of the voices involved is an *inner part*. Ex. 47-4, tenor and bass, is excusable; Ex. 49-7 is wholly wrong. — \*5) The lower *g* in bass is better than the higher, because the latter makes parallel movement in all four parts; it is wise to avoid more than three parallel parts. — \*6) Too many wide leaps. — \*7) Measure 7 is excusable, as the soprano leaps *down* to the leading-tone (par. 31); the next measure is wrong, because of the wide leap *upward*. \*8) The repetition of a melody-note is slightly monotonous, but not wrong.

**75.** The object of these and all subsequent examples is, first, to furnish the student with a sufficient (if not exhaustive) illustration of the harmonic progressions, as a table to which he can refer in working out his exercises; second, and perhaps chiefly, to afford him a test to which he can apply his *ear*, and according to which he can and should cultivate his musical sensibility. *Therefore the examples must be studied at a well-tuned piano; they should be played through slowly and thoughtfully, each correct measure several times in succession, first emphasizing one part and then another, and, if possible, softly singing the soprano part (melody) each time.* The explanatory notes which follow each example should also be carefully studied.

**76.** The following general deductions, respecting the *soprano*, may be made from the above examples:

- Two *octave*-positions in succession are hazardous (Ex. 47-10, 11).
- Two positions of the *fifth* in succession are always poor (Ex. 49-6, 7).
- Wide* leaps in soprano, especially to sensitive tones (chord-fifth, leading-tone), are hazardous (Ex. 48-6, 7, 8; Ex. 49-2, 5, 6, 7).

## THE REVERSED SUCCESSION, V-I.

77. *a.* From the octave-position of the V. *b.* From the position of the third. *c.* From the position of the fifth.

Ex. 50.

\*1) The leading-tone, in the tenor, is led *downward* to *g*, instead of upward (67). This is permissible on two conditions: first, that it occurs only in an *inner* part; second, when it is preceded by a higher tone, — that is, when it is on the way down, as in Ex. 16. See Ex. 51*d*, *e*. Further, it must not descend with any *wide leap*, — excepting, always, during chord-repetition.

78. As stated in par. 73*b*, the above progression, from V to I, is one of the most urgent, most nearly inevitable chord-movements in music. This, and all similar successions, *in which the chord falls one harmonic degree*, will be distinguished in this book as the **Normal progression**.

## FUNDAMENTAL PRINCIPLES.

The tonic triad (I) can progress to any other chord.

Every chord can progress to the dominant triad.

The dominant chord is characterized by the leading-tone.

Successive octaves in *contrary* motion are allowed, but not fifths.

Successive positions of the 5th are not good.

The Normal progression of a chord is a harmonic degree (perfect fifth) downward, — from root to root.

## EXERCISE SIX.

Connect, as in the above examples, the I-V in G major; the V-I in B-flat major; the I-V in E major; and the V-I in D-flat major. Each in as many ways as possible, but carefully avoiding all errors or doubtful movements. Review par. 64.

## THE PERFECT CADENCE.

79. A cadence is an interruption or momentary pause in the rhythmic movement; a stopping-place, or point of repose in the sentence, which indicates the end of a melodic member or section of the composition. A cadence is made with at least two chords; the *final* one of these is called the cadence-chord. *All cadence-chords fall on an accented beat*. Cadences differ in force or weight, partly according to the importance of the cadence-chord, and partly to its length. In order to interrupt the rhythm, the cadence-tones should be somewhat longer than those which adjoin.

80. The *perfect cadence*, or full stop, which occurs at the end of the entire sentence, is the combination of the four following conditions: 1, *The tonic triad*; 2, *in octave-position* (root in both outer parts); 3, *on an accented beat*; 4, *preceded by the dominant triad (in any position)*.

For illustration:

Ex. 51.

Diagram illustrating the perfect cadence (V-I) in five phrases (a. through e.), showing the progression of chords and the final cadence (V-I) in each phrase. The notation includes treble and bass clefs, time signatures (C or 3/4), and chord symbols (V, I, B, B<sup>b</sup>). A note is directed to Ex. 50.

THE PHRASE.

81. a. The smallest limits within which a harmonic and melodic thought may be adequately expressed is the **Phrase**. It is distinguished from larger forms in having but one positive rhythmic interruption, namely, the *perfect cadence* at the end.

b. It is usually *four measures in length*; occasionally one-half, or double this length (two measures, or eight measures); seldom an uneven number, as 3, 6, or 9 measures.

c. It commences with the tonic triad, *in any position*, and upon an accented or unaccented beat at option; and closes, is already stated, with the perfect cadence (V-I) upon an accented beat (either accent) of the fourth measure, — sometimes the second, or eighth, measure.

82. The outline of a phrase of two measures, in 4-4 time, will be then as follows:

Ex. 52.

Diagram illustrating the outline of a phrase of two measures in 4-4 time, showing three variations (a., b., c.) with cadence markings and chord symbols (I, V, I).

83. The unoccupied beats, in these outlines, may be supplied with the tonic and dominant triads in the following manner, the melody-notes being chosen according to Rule I (par. 64):

Ex. 53.

Diagram illustrating the unoccupied beats in the outlines, showing two variations (a., b.) with chord symbols (I, V, I, V, I).

The regular alternation of I and V in Ex. 52c would displace the perfect cadence, by shifting the I to an unaccented beat, thus:

Ex. 54.

(Ex. 52c)

I V I V I or I V I V I V I

To avoid which, one of the chords must be repeated:

Ex. 55.

(Ex. 52c)

V V or V V

84. The repetition of a chord in the course of a phrase is extremely desirable, for many good reasons. It checks the monotony of constant change of chord; it cancels all limitations (see par. 68), and provides full liberty for any desired movements (wide skips) in the melody, and other parts. In a word, the best — possibly the only — way to extract the musical contents out of a chord, is to *dwell upon it*. See Ex. 18; Ex. 12b.

85. But chord-repetition itself is subject to one *rhythmic* rule, namely: A chord (more correctly, a bass tone) may be repeated from an *accented* beat into the following unaccented beat or beats, but, as a rule, *not from an unaccented beat*. In other words, the chord (bass tone) should be *changed at the bar, or accent*, because the accent is the exponent of a new rhythmic group, and this should be confirmed by the announcement of a new chord. Compare par. 5. The following location of the chord-repetition is irregular:

Ex. 56.

I I

It occasions what might be called a *rhythmic halt*.

86. An exception to this rhythmic rule is always admitted at the *very first* accent of a phrase. Thus:

Ex. 57.

\*1) This unaccented beat is simply *preliminary*, and is never included in the actual metric design of the phrase. Such preliminary beats are, however, usually deducted from the cadence measure.

87. Other exceptions to the rule are:

a. A chord or bass tone which *begins* a measure may always extend throughout its measure (without regard to the secondary accent). See Ex. 45, which is correct rhythm. Also Exercise seven, bass *d*, 2nd measure.

b. At a cadence, or at the lighter interruptions between distinct melodic members of a sentence, the new member may begin with the same chord, or bass tone, with which the preceding member ended; because these two (similar) chords, in their relation to their respective members, lose their rhythmic connection with each other. For example (note the slurs):

Ex. 58.

88. The melody (soprano) of these examples may also be constructed in the following ways:

Ex. 59.

But they are somewhat less smooth and natural than the construction of the soprano as shown in Ex. 53. In this manner, however, the soprano should be tested and improved until the very best melody has been found that the given harmony will yield.

89. After the phrase-melody has thus been defined, the inner parts are added in the usual manner. Ex. 53b, completed, is as follows:

Ex. 60.

## FUNDAMENTAL PRINCIPLES.

All cadence-chords fall upon accented beats.

The perf. cadence is made on the I, in 8ve-position, accented, and preceded by the V.

A bass tone should not be repeated over the bar, or over an accent, as a rule.

Avoid monotony in the melody, but also too many wide skips.

## EXERCISE SEVEN.

The following given basses, indicating certain harmonic progressions in phrase-form, are to be supplied with soprano, alto and tenor, as shown above.

N.B. The soprano must be written out complete, before the inner parts are filled in. The bass notes are successive *roots*. The numbers above the notes refer to the *position* (soprano note) to be taken; the sign + before a number indicates the *high* position; the sign -, the *low* position. The last bass ("numbered bass") is to be written out in the given key, and in other keys, and treated like the others.

a.  $\frac{3}{2}$  +3 5 8 8

b.  $\frac{3}{4}$  3 5 8 3 -3 5 3

c.  $\frac{6}{4}$  -3 8 5 8 8 3 5

d. A major.  $\frac{3}{4}$  +3 3 5 | 3 5 3 | 5 8 3 | I I V ||  
\*1)

\*1) Value, dotted half-note.

N.B. These phrases are not to be tested at the piano until after they have been carefully and *completely* worked out at the table. Those who prefer to work independently of the given positions may of course ignore them, and choose their own melody (perhaps a number of different ones). In this case pars. 76 and 68 must be consulted.

N.B. To this exercise the student must add a number of **Original** basses (in phrase-form), according to the given rules, and imitating the given basses. It is well to write the bass alone, first, and then to add the upper parts. But, if preferred, all four parts may be written together.

## THE SUBDOMINANT TRIAD, IV.

90. This is not the *fundamental* representative of the Second Class of non-tonic chords (par. 70), as will be seen. But it is important in its class, on account of its perfect-fifth relation to the tonic note. Its characteristic feature is, the possession of the 6th and 4th steps of the scale (the tones with downward tendencies), which distinguish it from the dominant triad (par. 73).

91. The position of the third is preferable to either the pos. of the octave or that of the fifth.

92. The IV bears the same relation to the I that the V does (a harmonic degree), and therefore its connections with the I are as natural and convenient as those of the V. Review pars. 74, 75-

93. The connection of the IV with the I is as follows:

Not so this one, however, which consists of the tonic triad in alternation with both the dominant and subdominant triads: *i.e.*, the progressions I-IV-I and I-V-I, with frequent repetitions.

Ex. 64.

I - IV - I - V - I IV I - V Cadence

The consistent and symmetrical construction of this melody is shown by the brackets and slurs.

EXERCISE EIGHT.

Add inner parts to Ex. 63<sup>b</sup> and Ex. 64; and work out the following basses as before.

Review the remarks before and after Exercise seven. Complete the soprano before filling out the inner parts.

*f.*  
D<sup>b</sup> major,  $\frac{2}{4}$  I IV | I I | V I | V V | I I | IV IV | I V | I ||

\*1) The slurred figures indicate that the chord is to appear twice in the upper parts, in different positions. This is done for the sake of the rhythm. — \*2) Work out this numbered bass in other keys also. — N.B. To this exercise, add Original phrases, as before.

96. That these simple triads may be effectively employed in phrases, devoid of all embellishment, is proven by the following extracts from two of the most romantic composers.

Ex. 65.

a. *Andante sost.* CHOPIN. *Noct. Op. 37-1* etc.

E<sup>b</sup> I IV I IV I V I V I IV I V (VI) V I

\* This irregular chord-repetition is probably justified by par. 87<sup>b</sup>.

WAGNER. "Rheingold."

D $\flat$  I - - IV I - V I I V - I - IV I - IV - etc.

CONNECTION OF THE SUBDOMINANT AND DOMINANT TRIADS.

97. The foregoing examples illustrated the connection of the tonic triad with the dominant and subdominant triads respectively; it now remains to consider the combination of these latter (non-tonic) chords with each other. This involves a new phase of chord-progression, because the IV and V are not only not related to each other by a harmonic degree, but are not even related by coincidence of tones (*i.e.*, they possess no tone in common). Lying in opposite directions from the tonic, they are *two* harmonic degrees apart, or, when placed nearer together, one scale-step apart (Ex. 8a). Thus:

IV (I) V IV V

98. All chord-progressions of this kind, where there is no common tone, are recognized by their *neighboring roots* (lying side by side in the scale), and will be distinguished in this book as **Foreign progressions**. Comp. par. 78.

99. Foreign chord-progressions are more difficult than any others, because of the absence of a common tone as natural connecting-link. Hence, greater care must be taken to avoid disconnectedness, forbidden parallels, etc. In a word, the rules need to be applied with more rigor than usual.

- a. *Wide skips are almost entirely prohibited, in every part; and, in the case of IV-V,*
- b. *All three upper parts should move in contrary direction to the bass.*

Ex. 66. IV-V

IV V 67c 65 67b etc.

\*1) This may be admissible, because skips in an inner part are not so noticeable as in soprano; but it is very exceptional. — \*2) Doubled leading-tone. — \*3) Allowable, because the fifth of the first triad is omitted. — \*4) This measure is wrong, because the ear will not follow the tenor in its skip from *c* down to *g*, but associates the *c* with the following *d* of the alto, so that parallel 5ths are distinctly heard. This error, which *sounds* like successive 5ths without their actually appearing in the same pair of voices, is called *ear fifths*. They are worst in foreign progressions. Every doubtful progression in this example emphasizes the two rules of par. 99.

100. a. The reversed connection, V-IV, is unnatural, and therefore to be avoided. This is because the leading-tone in the V is so suggestive of the tonic harmony, that the IV (in which the tonic is only the chord-fifth) sounds disappointing, especially when the leading-tone is in the soprano; when it is in an inner part, the progression is less noticeable, though hardly less objectionable.

b. All chords are attracted by the tonic class, which they must ultimately reach; and that chord which lies nearest to the tonic (the V) is attracted so strongly that it can progress nowhere else, *legitimately*. Hence the canon of harmonic movement:

The chords of the *dominant class* progress legitimately into the *tonic class*; not into the subdominant. Review par. 73b.

The rules of par. 99 are valid here also.

Ex. 67. V-IV

\*1) possible

V - IV V (IV) V

\*1) The direct succession of *leading-tone* and *chord-fifth*, in the prominent *soprano*, is what makes this example worse than the following ones, where it appears in an inner part.

\*2) The best way to excuse the unusual progression V-IV is, as seen in these last measures, to *return* immediately to the V.

FUNDAMENTAL PRINCIPLES.

The subdominant chord is characterized by the 6th and 4th scale-steps.

In all triads, the position of the third is generally the best.

When the roots are adjacent scale-steps, the progression is *Foreign*.

In Foreign progressions no wide skips are allowed, and the upper parts move contrary to the bass.

Dominant chords progress, legitimately, only into tonic chords.

EXERCISE NINE.

In the first bass the positions are purposely omitted. It may be worked out at the blackboard, with the teacher.

a. FAISST b. 8 \*1) 3 3 +3

c. \*1) +3 53 +8 38 -5

d. \*2) 3 -35 e. 8 -8 5

This "customary" signature is the most convenient one that can be found; but it attacks the 7th scale-step also, and therefore an *accidental must always precede the leading-tone, in the harmonic minor*, to restore it to its proper place in the scale. Thus:

It must be distinctly understood that this signature does not indicate E-flat major. It is *borrowed* from that key, for convenient application to C minor. (The keys whose signatures thus correspond, are called "relative" major and minor. See later.)

**106.** The downward tendency of the 6th scale-step is made more urgent in minor (in consequence of lowering it), for which reason it might be called the "dominant leading-tone."

*a.* In minor the 6th scale-step (*dom. leading-tone*) must progress downward, — excepting in chord-repetition; and it should not be doubled.

*b.* It is forbidden to progress from one leading-tone to the other (7th scale-step to the 6th, or 6th to 7th).

Not only because each of the tones would progress in the wrong direction, but because the succession involves an unnatural chromatic interval (an *augm. 2nd*) which it is difficult to sing true, and which sounds peculiar. This error is best avoided by close attention to par. 67*a, b*.

This succession may be produced on an instrument, it is true, but it always sounds unnatural, and is appropriate only where a weird effect is desired.

**107.** The chord-progressions in minor are of precisely the same quality as in major, and are executed *in precisely the same manner*, according to the same rules (par. 106*a* merely emphasizes a former rule).

---

#### FUNDAMENTAL PRINCIPLES.

The minor scale is derived from the major scale of the same tonic.

The harmonic minor scale differs from the major at the 6th and 3rd steps, which are *lowered a half-step*.

The dominant chord is alike in both modes.

The 6th scale-step in minor *must* progress downward.

The two leading-tones (6th and 7th steps) must not succeed each other in the same part.

*There is no essential difference in the treatment of the major and minor harmonies.*

---

#### EXERCISE TEN.

The signatures prove that the following basses are in *minor*. The accidentals below certain bass tones refer to the third of the chord (in bass *a*, *f#*, the leading-tone; comp. Ex. 69), and are rendered necessary by the absence of the corresponding accidental in the signature. Review par. 105. The accidental must appear in that upper part which has the leading-tone.

a. **FAISST** b.

c.

d.

e.

f.

g. 
$$F\sharp \text{ minor. } \frac{3}{4} \quad \overset{3}{I} \quad \overset{3}{V} \quad | \quad \overset{3}{I} \quad \overset{3}{IV} \quad | \quad \overset{3}{V} \quad \overset{3}{I} \quad \overset{3}{IV} \quad | \quad \overset{5}{I} \quad \overset{5}{I} \quad | \quad \overset{3}{IV} \quad \overset{3}{V} \quad | \quad \overset{3}{I} \quad \overset{3}{I} \quad \overset{3}{I} \quad | \quad \overset{3}{V} \quad \overset{3}{V} \quad \overset{3}{I} \quad \overset{3}{V} \quad | \quad \overset{3}{I} \quad ||$$

\*1) 106a. — \*2) 99b. — \*3) Rhythm , of course. — \*4) The bracket indicates that both chords belong to one beat. The tie signifies here, as elsewhere, that the chord is to be held, not reiterated; the rhythm of this measure is therefore or .

To this exercise, add a number of Original phrases.

THE SUBORDINATE TRIADS, IN MAJOR.

108. See Ex. 33. The three subordinate triads should not be regarded as new and independent harmonies, but merely as modified forms of the principal chords. They are the relatives or parallels of the latter, and serve chiefly as substitutes for them, for variety. The relation is defined by the principal scale-step which each subordinate chord contains. In the VI of C major, for example, the most important of its three tones, in the key, is its *chord-third*, the tonic note c:

C major  
Ex. 71. — principal tone  
VI

This proves that the ruling element in this chord is the tonic, which places it among the chords of the tonic class. The same test, with the other two subordinate chords,

C major.  
Ex. 72. — prin. tone. — prin. tone.  
II III

shows that the II belongs to the subdominant, the III to the dominant class. That is: The I and VI together represent the Tonic class;

The IV and II together represent the Subdominant or Second-dominant class; and The V and III together represent the Dominant class. See par. 70.

\*1) It will be observed that the "related" chords are the exponents of those major and minor modes which have the same signature.

109. The functions of the related triads, though not identical, are so very similar as to justify this classification. The subordinate chords act mainly as *substitutes* for their respective principal chords, and deduce almost all their harmonic regulations from the latter.

THE SECOND-DOMINANT TRIAD, II.

110. a. This is in reality the *fundamental* representative of the subdominant or Second class, as will be seen later on. Comp. par. 90.

b. The best position is that of the *third*.

c. The octave-position, in a subordinate triad, is more objectionable than in a principal one, because undue prominence is given to a subordinate step of the scale, in placing it thus in both outer parts. Still, the octave-pos. of the II is not forbidden, because it is the best of the subord. triads.

d. The position of the fifth is very objectionable in this triad.

111. Either the third or root may be doubled. No interval can be omitted. Review par. 59, 60, 61a.

112. Being a subdominant chord, the II contains the 4th and 6th steps of the scale. Care must be taken to lead them downward, — especially in soprano.

113. The following examples illustrate the *progressions* of the II, in the order of natural preference. See par. 109.

a. The Normal progression, II-V (par. 78).

Measure No. 3 is good, because of the skip *down* to the leading-tone (par. 31). No. 5 illustrates a very common movement, — the *deferred resolution*. (The term "resolution" is applied to the progression which fulfils the tendency of any active tone.) The 4th scale-step in soprano reaches the 3rd step indirectly, after the interposition of one convenient tone. No. 4 is doubtful, because the resolution is entirely evaded. No. 9 is an unusual exception to several rules: the alto has the deferred resolution of step 4; the soprano may be justified by Ex. 16-2.

b. The progression to the tonic triad. This is a **Foreign progression**, and a rare one. It is rather singular, that no other chords can progress into the I excepting the V and the IV (the two triads related to it by the harmonic degree). The II abhors the *direct* progression into the I, always preferring to move first into the V.

\*r) In every foreign progression excepting IV-V (Ex. 66, where *both are prin. triads*) it suffices to lead *two* upper parts contrary to the bass; the other one moves in 3rds parallel with the latter.

c. The progression to the IV.

This progression, from the II into *its own principal triad*, is not good.

When the two representatives of the same class are connected, the subordinate triad should *follow*, not precede, its own principal triad. In other words: of the two parallel chords, the principal triad comes first. Thus, the IV can progress to the II, but the II cannot progress to the IV. And the same applies to the other classes; I-VI is correct, but VI-I is wrong; V-III is allowed, III-V is incorrect.

\*r) This is a rare exception to par. 73c.

114. The triads which *introduce* (i.e., precede) the II are exhibited in the following examples; arranged, as before, in the order of preference.

a. From its *relative* prin. triad, the IV.

\*r) The connection of *relative triads* is considered nearly equivalent to *chord-repetition*. Therefore, the licences of par. 68 are valid here, with slight limitation. This accounts for the wide leaps in the soprano in these three measures, — even measure 6, from the chord-fifth *c*. It also tends to excuse the pos. of the fifth in the II (measure 7). — \*2) Comp. Ex. 74-9.

b. From the tonic triad: a Foreign progression.

Ex. 78. I-II

\*1) Ex. 75, Note \*1). — \*2) These wide skips are a little less objectionable than usual, because both tones (*f-c*) are principal steps of the scale.

c. From the dominant triad.

This Progression (V-II) is the counterpart of Ex. 67 (V-IV), because the IV and II are parallels, and in each case the V does not progress, as it should, to a *tonic* chord (par. 100b). Nevertheless, the progression V-II may be more readily effected than V-IV, on account of the relation of a harm.

degree which the triads represent

The first measure of the following example shows the most rational connection, similar to Ex. 67-4, 5.

Ex. 79. V-II

\*1) The skip from the leading-tone is wrong, because it is not chord-repetition.

\*2) This soprano is wrong. Only when the V progresses to a tonic chord, has it the effect of a *dominant* chord. In this measure it sounds like the I of G major, and the *f* in soprano (instead of *f*♯) is therefore disagreeable. When the *f* is introduced with a skip from below, as in the first two measures, the impression of G major is weakened. — \*3) Here the incorrect progression of the leading-tone, followed by the forbidden position of the 5th, renders the false impression of the key still more palpable.

115. The following melody illustrates the predominance of the *position of the third* in the II.

Ex. 80.

\*1) In adding the inner parts, the third of this chord must be doubled.

FUNDAMENTAL PRINCIPLES.

The VI is a tonic chord, the II a subdominant or Second-class chord, and the III a dominant chord. In the II, the position of the 3rd is the best; that of the 5th rare. The downward tendency of scale-steps 4 and 6 must be respected in all second-dominant chords. A subordinate triad does not progress into its own principal triad. The V should progress to a tonic chord, — not to the second-dominant chords.

EXERCISE ELEVEN.

e.

D $\flat$  major.  $\frac{2}{4}$  I I | IV II | V V | I I | IV IV | II V | I V | I ||

\*1) Par. 112.  
 Bass e should be worked out in several other keys, with other positions.  
 To this exercise, add a number of **Original phrases**.

THE SUBMEDIANT TRIAD, VI.

116. Review par. 109. a. The best position is that of the *third*.  
 b. The *octave-position* is forbidden.  
 c. Third or root may be doubled. Par. 61a.

117. The progressions of the VI are exhibited in the following examples, in the order of their preference.

a. The **Normal progression** (to the II).

b. To the V: **Foreign progression**.

Ex. 81. VI-II

VI II II

Ex. 82. VI-V

VI V

c. To the IV.

Ex. 83. VI-IV

\*1) Par. 31 excuses these wide leaps in soprano. — \*2) Also excusable, though the first tone (*e*) is a chord-fifth. —

\*3) Not very good, because of the wide leap down to step 6, and the irregular duplications.

d. To its own relative, the I. Forbidden progression. See Ex. 76.

118. The VI may be introduced (preceded) by the other triads, in the following order:

a. By its relative, the I. (Comp. Ex. 77.)

Ex. 84. I-VI

\*1) See Ex. 77, Note \*1).

b. By the II: an ascending harmonic degree.

Ex. 85. II-VI

\*1) The soprano is unnatural, because it stumbles beyond the expected half-step progression, *f-e* (as in the measure before). The 4th and 6th steps should proceed *diatonically* downward, whenever they can.

c. By the V: Foreign progression.

Ex. 86. V-VI

Par. 119

d. By the IV.

Ex. 87. IV-VI

\*1) These two measures violate par. 99a, but are excused by the quality of the tones in the leap, — tonic and dominant. Comp. par. 76c. — \*2) Ex. 85, Note \*1).

119. The chord-progression in Ex. 86 is no contradiction of the spirit of par. 73*b*. The VI is a *tonic* chord, and therefore is quite as apt to follow the V as is the I itself. It is often called the *Deceptive* progression, — V-VI, where V-I is expected.

## EXERCISE TWELVE.

*f.* G major, and other keys.

$$\text{I} \overset{+5}{\text{I}} \overset{3}{\text{I}} \text{II} \text{V} \mid \text{VI} \text{II} \text{V} \mid \text{I} \text{VI} \text{IV} \text{IV} \mid \overset{-5}{\text{II}} \overset{3}{\text{II}} \text{V} \text{I} \parallel$$

To this exercise, add a number of **Original phrases**.

## THE MEDIANT TRIAD, III.

120. This chord lies most remote from the tonic centre, and is therefore the weakest, least frequent, and most embarrassing of all the triads. See par. 69*b*; Ex. 73*a*. It is usually brief, and creates the impression of an intermediate “passing” chord, in the following connections.

121. The III may progress:

- to the VI (the **Normal progression**); and
- to the IV, *i.e.*, the *nearest prin.* triad (Foreign progression).

122. It may be preceded:

- by the I (because the I can pass into every chord, — par. 71);
- by the VI (an ascending harm. degree); — and
- by its own principal triad, the V.

123. The position of the III depends upon the chord which *follows* it.

- Before the IV, the III takes the position of the *fifth* (exceptionally the pos. of the *third*).
- Before the VI, the III takes the position of the *third*.
- The triad which *follows* the III is always best in the position of the *third*.

Thus:  $\overset{5}{\text{III}}-\overset{3}{\text{IV}}$ , or  $\overset{3}{\text{III}}-\overset{3}{\text{IV}}$ ; and  $\overset{3}{\text{III}}-\overset{3}{\text{VI}}$ .

From the I:                      From the VI:                      From the V:

into the IV;    into the VI.    into the IV;    into the VI.    to the IV;    to the VI.

3                      5                      5

Ex. 88.

IV                      VI                      IV                      VI                      IV                      VI

Exceptional:

IV

124. *a.* From this it is seen that the III has no connection with the II. The progression would be *foreign*, and *both chords are subordinate*. Ex. 88-4 is somewhat doubtful, because there are too many weak chords in direct succession.

*b.* The Foreign progression of the III (into the IV) is more common, and apparently better, than its Normal progression (into the VI), — probably because the weak III obtains more support from the *principal triad* (IV), especially as it lies nearer. Compare par. 396.

125. The 7th scale-step, as chord-fifth in the III, seems to forfeit much of its characteristic quality as leading-tone. As seen in Ex. 88, its movement is generally *downward* (as in Ex. 16-1), — invariably so when the IV follows, on account of successive 5ths with the bass.

#### FUNDAMENTAL PRINCIPLES.

The I passes into *all* other chords. The V passes into I and VI.

The IV passes into every chord, excepting into the III.

The II passes into V and VI; and follows the IV, I and VI.

The VI passes into every chord, excepting the I; and follows *every* triad.

The III passes into IV and VI; follows the I, VI and V.

The best position for all triads is that of the *third*; especially for subordinate triads.

In the VI, the octave-position is forbidden; in the II, the position of the fifth is poor.

In the III, the leading-tone usually descends.

#### EXERCISE THIRTEEN.

*a.* 3 5 8 \*1) FAISST δ. -3 3\*2) \*3) 5

EXERCISE FOURTEEN.

To this exercise, add a number of Original phrases.

THE PERIOD-FORM.

129. The period, or double-phrase, consists of two phrases, and is therefore usually eight measures in length. The first of these is called the Antecedent phrase. It has its cadence, like any phrase, on an accent of the fourth measure; but as it is only the first half of the entire sentence, its cadence must be less complete than the final (perfect) cadence. Review par. 79. Every such lighter rhythmic interruption is called a semi-cadence.

The second phrase is called the Consequent, and closes with the perfect cadence.

130. A semi-cadence differs from the full stop only in the *choice of chords*. As a rule, any succession of fairly strong chords will constitute a semi-cadence, but the most appropriate and common chord is the *dominant*,—preceded by any suitable chord (I, IV, II, VI). The cadence-chord falls on an accent, of course.

131. There is a close general relation between the two phrases, which represent “question” and “answer.” They are likely to begin on the same beat, and close on corresponding accents. The following example is the outline of an 8-measure period, in 3-4 time, with the dominant semi-cadence:

\*1) This semi-cadence, I-V̂, is harmonically the reverse of the perfect cadence (V-Î) and therefore constitutes the most consistent/antithesis to the latter. The V may, however, be preceded by any other good chord. A semi-cadence

upon the IV is heavy; its relative, the II, although a subordinate chord, is better. The I can be employed as semi-cadence chord, but *not in octave-position*. It is not very good, however, as it furnishes too little contrast with the perf. cadence. Its relative, the VI, is somewhat better. The III, as intimated, is too weak (par. 120). The student can substitute these different forms of the semi-cadence for the one given in Ex. 90, and judge of their comparative effect.

\*2) Here the unusual succession V-IV is turned to account at the point where the narrow relation of chord to chord is overbalanced by the broad relation of phrase to phrase. Comp. par. 87*b*, which indicates exactly the same principle.

\*3) This longer note is necessary for the semi-cadence chord, in order to interrupt the rhythmic movement.

FUNDAMENTAL PRINCIPLES.

Of the subordinate triads in *minor*, only the VI is a concord.

The semi-cadence is *any* succession of good chords, in cadential location, that do not form the *perfect* cadence.

The best semi-cadence chord is the V.

EXERCISE FIFTEEN.

- A. Complete Ex. 90, in C, B $\flat$ , A $\flat$  and F $\sharp$  major; using a different semi-cadence in each version.
- B. Point out the general errors in the following:

- C. Write a number of Original periods.

THE HARMONIZING OF MELODIES. PRINCIPAL TRIADS.

132. The harmonizing of a melody consists in assigning to each successive tone its proper chord. The scale-steps which each principal triad contains are shown in the following table:

The first scale-step occurs in *two* primary chords, the I and IV; and the fifth scale-step occurs both in the V and the I. At these places, of course, choice must be made between the two chords; but all the other steps of the scale represent, originally, but one primary chord.

133. The application of this table to any given melody defines the harmonic basis, or bass part. Thus:

Ex. 92.

Melody: 

Harmony:  $\left\{ \begin{array}{l} I \\ V \end{array} \right\} \left\{ \begin{array}{l} I \\ IV \end{array} \right\} V \quad I \quad IV \quad V \quad \left\{ \begin{array}{l} I \\ IV \end{array} \right\} V \quad V \quad \left\{ \begin{array}{l} I \\ IV \end{array} \right\}$

134. Where a choice is to be made between two possible triads (at the 1st and 5th scale-steps) the following rules must be considered:

- The very first chord is the I; the last two chords the V-I (par. 81c).
- The rules of chord-succession and chord-repetition must be respected (par. 100a, par. 85).
- The chords must not be so chosen that any two successive melody-notes would be *chord-fifths*; successive roots (octave-positions) are also hazardous, but not impossible, — Ex. 47, Note \*3). See also par. 99a, b.
- A *wide* leap in the melody almost always indicates *chord-repetition* (par. 84).

Applied to Ex. 92 the result is:

Ex. 93.

\*1) \*2) \*3) \*4)

\*1) The V is cancelled by par. 134a. — \*2) The IV would make parallel 5ths with both the preceding and following chord. See also 134d. — \*3) The IV is cancelled by 134b (V-IV); also by 134c. — \*4) Par. 134a.

Further:

Ex. 94.

Scale-steps: <sup>\*1)</sup> 1 <sup>\*2)</sup> 5 <sup>\*3)</sup> 1 <sup>\*4)</sup> 6 <sup>\*5)</sup> 1 <sup>\*6)</sup> 2 <sup>\*7)</sup> 5 <sup>\*8)</sup> 3 <sup>\*8)</sup> 2 <sup>\*8)</sup> 1 <sup>\*8)</sup> 5 <sup>\*8)</sup> 4 <sup>\*8)</sup> 3 <sup>\*8)</sup> 5 <sup>\*8)</sup> 6 <sup>\*8)</sup> 5 <sup>\*8)</sup> 1

Chords: (IV) I (IV) IV I V V I V (IV) (V) IV I — IV V I (I) (IV)

\*1) Begin with the I. — \*2) Either chord is possible. See par. 134d. — \*3) In either case the IV is not feasible. Also because of faulty repetition, into the following accent. — \*4) The IV makes 5ths with the next chord. — \*5) The I is cancelled by the faulty repetition into the following accent. The *first* of these wide leaps calls for chord-repetition (134d); the next wide leap cannot be the same chord. — \*6) The IV will not follow the V (with *parallel* soprano). — \*7) The V will not pass into the IV. — \*8) Perfect cadence, V-I.

Example 94, completed, would appear thus:

Ex. 95.

\*1)

\*1) Observe how the common tones, in the lower parts, are held as *longer notes*, instead of being restruck. This provides very necessary rhythmic variety. But see par. 5, Ex. 5 and Notes.

EXERCISE SIXTEEN.

A. Harmonize the following melodic fragments *at the piano*, at sight, with the three principal triads. First in major, and then in minor. Ex. 91 should be placed where it can be seen and referred to. The left hand may take the *bass alone*, and the right the three upper parts together.

\*1) Either V or I. — \*2) Must be the I, because the IV follows. — \*3) Change the chord at these accents. — \*4) The *key* defines the scale-steps, — and chords. — \*5) The V, because of the wide leap.

B. Add the bass and inner parts to the following melodic phrases, using *principal triads* only, as in Exs. 93 and 94. See *par. 242*.

Each of these phrases, when completed, must be played in the corresponding *minor* mode.

MELODIES, WITH SUBORDINATE TRIADS.

135. The application of the subordinate triads, in harmonizing a melody, is regulated chiefly by the fact that they appear as *substitutes* for their respective principal triads. This is strictly true of the VI and III, whereas the more important II can also be used as independent chord. Of significance is also the fact that they are limited, as a rule, to the position of the *third*. The details of their use are as follows:

136. a. The VI can be used in place of almost any I, but especially at the *first scale-step* (keynote). It is possible, but rare, at the 3rd scale-step (position of the 5th); impossible at the 6th step (octave-position). Ex. 96a.

b. The II is used in place of the IV, especially at the *fourth scale-step*. It is also good at the *second step* (its own step, as 8ve-position). It is possible, but rare, at the 6th scale-step (position of the 5th).  
 Ex. 96b.

Ex. 96. *a.* Step 1 Pos. 3rd Step 3 Pos. 5th Step 6 Pos. 8ve *b.* Step 4 Pos. 3rd Step 6 Pos. 5th Step 2 Pos. 8ve  
 VI (? ) ⊕ II ? good.

c. The III is applied chiefly to the *leading-tone when it descends diatonically* (comp. Ex. 88-1, 3, 5). When the 7th scale-step descends, thus, it cannot well be harmonized with the V (as is otherwise *always* the case), hence the substitution of its relative, the III. It is possible, but rare, to use the III at the fifth scale-step (position of the 3rd, — see Ex. 88-2, 4, 6, 7, 9); extremely rare at the third step (8ve-position).

Ex. 97. Steps: 7 8 7 6 5 6 5 4 3 2  
 V I III IV III IV III VI III VI  
 VI  
 rare doubtful

137. Just as the 7th scale-step, when it progresses exceptionally *down to 6*, cannot be harmonized with the V, but must be its relative, the III, — so the 6th scale-step, when it progresses exceptionally *up to 7*, cannot be the IV, but must be its relative, the II. Thus:

Ex. 98. I III IV II v I IV II v I

138. The complete table of all the triads, in major, is then as follows:

C major  
 Scale-steps:

Ex. 99. Chords: I V I IV v IV V II III  
 VI II VI (III) (II) (II) VI (II) III  
 IV (III)

139. Whether the second scale-step is to be harmonized with the V or II depends mainly upon the note which *follows*, or upon the rhythm. Thus:

Ex. 100. v I V I v v II v IV II IV v  
 v VI (II VI) II v (II)  
 II VI

140. In minor, the VI is the only subordinate chord used at present (par. 128).

FUNDAMENTAL PRINCIPLES.

The important scale-steps (1, 5, 4, 2) may be harmonized with their own triads (I, V, IV, II); the unimportant steps (3, 6, 7) are usually chord-thirds.

The three principal steps (1, 5, 4) may be harmonized with either chord of their class (1—I, VI; 4—IV, II; 5—V, [III]).

Only the important steps 1, 5 and 2 can become the position of the 5th, — excepting at the irregular progression of active steps 6 and 7, which must be chord-fifths.

EXERCISE SEVENTEEN.

Add bass and inner parts to the following melodic phrases, using all six triads. See par. 242.

Ex. 100-5. III

VI VI

V VI — Also Ex. 93.

THE INVERSIONS OF THE TRIADS.

141. "Inverting" a chord means, simply, placing some other interval than the root in the lowermost part. Thus, the triads, which have three intervals, may appear in three different shapes, as regards the condition of the bass, namely:

- a. As original triad or fundamental chord, with the root in bass;
- b. As first inversion, with the third in bass; and
- c. As second inversion, with the fifth in bass.

Ex. 101.

Fundamental chord      1st Inversion      2nd Inversion

I      I<sub>1</sub>      I<sub>2</sub>

Root      Third      Fifth

\*1)      \*2)

\*1) Spoken: "Tonic triad, 1st Inversion"; or more conveniently "One-one."

\*2) Spoken: "Tonic triad, 2nd Inversion"; or more conveniently "One-two."

Changing the chord-interval in bass does not alter the fundamental harmony, any more than the change of position in soprano does. Therefore the above forms are all named "the I."

**142.** In order to distinguish the bass notes as chord-third, or chord-fifth, from the bass note as root, figures are attached below them, which indicate the interval or intervals *from the bass note to the upper tones*, and define the *shape* and general denomination of the chord. Thus:

Triad    Chord of the *Sixth* \*2)    Chord of the *Six-four* \*3)

Ex. 102.

\*1) The figures (intervals) 5 and 3 are always understood, unless contradicted by 6 and 4 respectively; therefore they are usually omitted. The figure (interval) 8 signifies duplication, and is usually understood, in triads.

\*2) So called, because the column of intervals (from the lower tone upward) contains a *sixth*, —  $\frac{6}{3}$  instead of  $\frac{5}{3}$ .

\*3) In agreement with the bass-figuring, or *shape* of the column of intervals,  $\frac{6}{4}$ .

EXERCISE EIGHTEEN.

Attach the names (in Roman numerals) to the following chords, as indicated in the first measure.

When there are no figures, the bass note is a root. When marked 6, the bass note is a chord-third, the chord is a 1st inversion, and the root, and name, is found a 3rd below. When marked  $\frac{6}{4}$ , the chord is a 2nd inversion, and the root, and name, is found a 5th below. (See par. 51.)

E<sup>b</sup> major.  
I    IV<sub>2</sub>    VI<sub>1</sub>

B major.

And write the following chords in *figured bass notes*, as above: D major I<sub>2</sub>-III-IV<sub>1</sub>-V<sub>2</sub>-II<sub>1</sub>-VI-I<sub>1</sub>-VI<sub>1</sub>-III<sub>2</sub>-IV-II<sub>2</sub>-V<sub>1</sub>-VI<sub>2</sub>-III<sub>1</sub>-IV<sub>2</sub>-II; and the same chords, in reversed order, in G<sup>b</sup> major.

SECTION 2. THE CHORDS OF THE SIXTH.

C major. \*1)

Ex. 103.

\*1) These chords will be limited principally to the *major* mode, at present. Only those examples in which neither the II nor the III (or their inversions) occur, can be applied to minor also.

**143.** The first inversions appear most naturally as substitutes for their respective fundamental triads. The chord-third being a lighter interval than the root (par. 69c), it follows that the 1st inversions are lighter and more flexible than triads.

THE PRINCIPAL CHORDS OF THE SIXTH.

144. The chords of the sixth are classified, like the triads, as *principal* and *subordinate*. The prin. chords of the 6th are, naturally, the first inversion of the three prin. triads.

145. a. *The best position for every chord of the 6th is that of the octave (i.e., root in soprano, — see 145d).* Thus the quality of the bass tone as chord-third (instead of root, as the ear is apt to assume) is most clearly defined.

b. In the *principal* chords of the 6th, however, the root, *being a prin. tone of the scale*, can lie in an inner part without endangering the identity of the chord, in which case the soprano may take the *fifth*.

c. The position of the *third* should be avoided, as it doubles an inferior chord-interval in the *outer parts*.

d. *The position of a chord is always reckoned from the root*, no matter what interval the bass part chances to have. For example:

146. a. As a rule, *it is best to double the principal tones of the scale* (par. 59).

b. But in chords of the sixth *almost any tone* (excepting the leading-tone) may be doubled in order to obtain smooth voice-progression. Therefore, the prin. tones may be doubled, *whether root or fifth*. It is least desirable to double the bass note (*i.e., the third*) in *principal* chords of the 6th.

c. No *chord-interval* is ever omitted, in any inversion.

147. a. The inverting of a triad is attended by the following advantages: It facilitates the connections of the chords to such a degree that *almost any of the foregoing forbidden progressions become possible, when the second chord, or both chords, are inverted*. Thus, V-IV is doubtful, but V-IV<sub>1</sub> is good, and V<sub>1</sub>-IV<sub>1</sub> still better; VI-I<sub>1</sub>, VI-I<sub>1</sub> good; and so on.

b. As seen above, it simplifies the rules of duplication.

c. It simplifies the rules of melodic progression so that successive positions of the 5th or 8th are allowed when one (especially the second) chord, or both chords, are inversions; and wide skips to the 5th in soprano are less objectionable than in triads.

d. It conduces to the melodic smoothness of the bass part, which has precisely the same melodic choice of root, third (or fifth), as the soprano has. Compare the basses in the following exercises with those of the preceding ones.

148. The following tables exhibit the *progressions* of the three prin. chords of the 6th into *triads*, in the order of preference. Review par. 75.

Ex. 106. V<sub>1</sub>

Ex. 107. IV<sub>1</sub>

\*1) Exactly the same in C major and C minor. — \*2) Par. 147c. — \*3) Major only. — \*4) See Ex. 79, and compare par. 147a. — \*5) Par. 67a. — All the measures covered by Note \*1) must be played in C minor also.

149. The introduction of these chords (choice of *preceding* chord) is effected according to the same general principles, and can be found by simply *reversing each measure* of the above examples, — playing the second chord before the first. Particular attention is, however, called to the following exceptional cases:

Ex. 108.

\*1) Perfectly good, because the *second* chord is inverted (par. 147c). — \*2) These four cases show how an irregular chord-succession is rectified by inverting the second of the two chords (par. 147a). — \*3) Like Ex. 85, Note \*1). This illustrates how and when the *position of the 3rd* of the I<sub>1</sub> may be necessary. — \*4) The bass may leap *down* to the leading-tone, but not up (par. 31).

THE SUBORDINATE CHORDS OF THE SIXTH.

151. The only good subordinate 6th is the first inversion of the II. The VI<sub>1</sub> and III<sub>1</sub> are extremely rare.

152. Subordinate 6ths are limited almost wholly to the *octave-position*; because their roots, being subordinate tones, need to be in one of the outer parts, in order to be recognizable as roots. Par. 145a.

The exceptions to this rule are:

- a. The II<sub>1</sub> — which sometimes takes the position of the *third* (because it is a principal tone and endures duplication, even in outer parts).
- b. The III<sub>1</sub> — which, *when followed by the IV*, may (like the III itself) take the position of the *fifth*.
- c. During chord-repetition, any position can be taken, of course.

Ex. 109.

The II<sub>1</sub>      The III<sub>1</sub>      Repetitions

3      3      5      5      6      5      3      6      5

\*1)      II<sub>1</sub>      VI<sub>1</sub>

6      6      6      6      6      -      6      6      6

\*1) This is an exceedingly rare example of the doubled leading-tone. It is excused mainly by the fact that it is the III, and not the V, — see par. 125; partly, also, by the smoothness of the voice-progressions in soprano and tenor.

153. The *progressions* of the three sub. chords of the 6th, to triads, are as follows (in *major* only):

Ex. 110.

152a      124a      150

3      ⊕      ??

II<sub>1</sub>      II<sub>1</sub> III      VI      I

6      II      6      V      6      6      VI      6      I

Ex. 111.

Rare.

\*1)      \*2)      par. 150

??      ?

6      VI      6      II      6      III      6      IV      6      V

Ex. 109-4      par. 150

III   VI   IV   III<sub>1</sub>   II   III<sub>1</sub>   I

\*1) A succession of two weak chords. — \*2) Also in minor (par. 128).

154. The *introductions* will be found, as before (par. 149), by playing each of the above measures in reversed order. The following exceptional cases require special attention:

V   I   IV   II   V   IV   VI   II

\*1) Good, because the bass leap is made from the I (comp. par. 71). A strong chord can move with greater freedom than a weak one.

155. These examples again show that the movements of the chords of the 6th are dictated largely by *proximity of bass tones*. Comp. par. 150. The subordinate 6ths, especially, abhor wide leaps in bass. In this respect the inversions differ somewhat from the triads, whose harmonic actions are determined chiefly by *chord-relations*.

The thorough student must become fully familiar with all of these chord-movements. The above logical inferences will probably be of assistance, although, if need be, he must simply memorize each individual succession.

FUNDAMENTAL PRINCIPLES.

The only good subordinate 6th is the II<sub>1</sub>.

Subordinate chords of the 6th take the octave-position.

Chords of the 6th, especially when subordinate, should make no wide leaps in bass.

EXERCISE TWENTY.

\*1) Either one of these three tenor progressions can be taken; and the same with the two alto progressions in the following measure. — \*2) Comp. Ex. 109-4. — \*3) These wide bass leaps are good only with *principal* 6ths. — \*4) Also in minor.

159. The other successions of 6ths are made in the same manner, — *best when diatonic*, or with narrow leaps. The series may extend to three or even more chords, in which case parallel octaves and fifths must be guarded against. See par. 157c.

Ex. 115. Major.

\*1) The soprano runs in 6ths parallel with the bass. For three beats the alto moves contrary; then the inner parts turn, and the tenor runs opposite to the other three parts. — \*2) All four parts ascend, as it cannot be avoided; but there are no parallel 8ves or 5ths.

TRIAD AND SIXTH ON THE SAME BASS TONE.

160. According to par. 155, it is apparent that a chord of the sixth will connect very readily indeed with that triad which has *the same bass tone*, — for example, the I<sub>1</sub> and the III (bass tone *e*, in C major, — Ex. 116).

161. Chords which are so nearly alike as these (with only one note of difference), are very often connected during *one beat*, instead of using a separate beat to each chord. Thus:

Ex. 116.

The chord of the 6th may *precede or follow* the triad. The figure 5 denotes the triad, and is not understood in this case, because of the 6 which accompanies it.

162. Rules: 1st, the notes of difference 6 and 5 (*c* and *b* in this instance) are connected in *one and the same part* — usually in the *soprano*; 2nd, when connected on a single beat, the first of these notes should not be doubled. For example:

Ex. 117. I<sub>1</sub>

\*1) The lower three parts simply hold their tones. — \*2) The notes of difference are less effective in an inner part than in soprano. — \*3) Much too unquiet. — \*4) If the first tone (*c*) is doubled and then *held*, it makes a dissonance with the second tone (*b*), to be avoided for the present. — \*5) The second of the above rules applies only to the rapid connection, in a *single beat*; when each chord has its full beat, it is treated independently of the other.

163. The other chords of the 6th make this connection in the same manner:

Ex. 118.

65 II<sub>1</sub> 56 III<sub>1</sub> 65 IV<sub>1</sub> 56 65 VI<sub>1</sub> 56 65 66 66 66 66

\*1) As usual, separate measures. — \*2) These two couplets are perfectly correct, but they will not appear in the following exercise, because they involve chords which have not yet been explained (par. 53). — \*3) One or two exceptions of this kind (the second tone doubled) are justifiable. Observe the bass figuring; the horizontal rows (8-6, 5-6) indicate the course of the upper parts.

164. a. The rapid diatonic passing-notes (*i.e.*, the notes of difference), whether they lie in soprano or in an inner part, *must run on diatonically in the same direction*, if the following chord contains the required tone. Thus:

Ex. 119.

65 6 56 6 par. 67b 65 6

\*1) Here the soprano is right, because it fulfills the impulse of the rapid diatonic notes, and conforms to par. 26. — \*2) These two measures are awkward.

b. If, however, the succeeding chord should not contain the required tone, then the rapid part is more likely to *turn*, than to progress in the same direction with a skip, or remain on the same tone. Thus:

Ex. 120.

56 56 56 56 65

\*1) Compare measure 1. This soprano makes parallel 5ths with the bass part, which are as objectionable as if the second eighth-note (*d*) were not between; because unaccented fractions of beats do not fully intercept consecutive 5ths. The same applies to intercepted octaves.

FUNDAMENTAL PRINCIPLES.

In successive chords of the sixth the soprano generally moves in 6ths parallel with the bass; and one inner part runs contrary to the other three parts.

The couplet 6-5 or 5-6 should be placed unbroken in some part, — usually *soprano*; and the first tone should not be doubled.

Rapid diatonic tones generally run on in the same direction.

EXERCISE TWENTY-ONE.

It is well to complete the soprano before filling out the inner parts.

a. \*1) \*8)

b. \*1) \*2) \*3) 5 +8 \*2) \*8) 3 8

c. +8 \*1) \*2) 8 \*5) -3 -5

d. \*8) +8 \*4) 3 -3 8 5 FAISST

e. +8 \*5) 3 3 5

f. 3 5 \*2) 5 8

g. +8 \*9) \*5) \*7)

h. 8 \*5) 6 \*8)

F major.  $\frac{2}{4}$  I VI IV<sub>1</sub> | II<sub>1</sub> V III<sub>1</sub> | I<sub>1</sub> IV IV<sub>1</sub> | I | II V<sub>1</sub> V | I V<sub>1</sub> IV<sub>1</sub> III<sub>1</sub> | II<sub>1</sub> V | I ||

\*1) Par. 162. — \*2) 164a. — \*3) 157a, and c. — \*4) Par. 67b. — \*5) 164b. — \*6) The line below the bass note indicates that the soprano holds its tone, — perhaps one or both inner parts also. — \*7) The line denotes that the soprano note is to be held. — \*8) This bass illustrates diversity of rhythm, somewhat like Ex. 95, Note \*1). — \*9) 123a, and c. To this exercise add a number of **Original phrases**.

## MELODY-HARMONIZING. CHORDS OF THE SIXTH.

165. The use of chords of the sixth, in harmonizing a melody, is controlled by the following general principles:

a. The choice of *chord* is made almost precisely as before, according to the table, Ex. 99, — which review, thoroughly.

b. The chord-third is used in bass most commonly *when the soprano (melody) has the root* of the chosen chord. (Comp. par. 72 and par. 145a, — “root in bass, third in soprano; root in soprano, third in bass.”) This is almost invariable in *subordinate* chords.

c. The first inversion may, however, be used when the chord-fifth is in soprano; but only in principal chords.

The following table, showing inversions only, may be *added* to Ex. 99:

Scale-steps:

Ex. 121.

$I_1$   $IV_1$   $(III_1)$   $IV_1$   $V_1$   $(IV_1)$  No 6th  $III_1$

For example:

Ex. 122.

$I$   $I_1 V$   $I IV_1 V$   $I_1 II_1 V$   $I$   $I$   $I_1 IV II_1 V$   $V_1 I$   $IV_1 V$   $I_1 V_1 I$   $I_1-II_1 V I$

\*1) “Root in soprano, third in bass.” — \*2) Here, and two beats later, the chord of the sixth is used with the chord-fifth in soprano, — being *principal* chords. — \*3) The chord is repeated over the accent, but the *bass* changes, — par. 166.

166. There is little or no objection to the repetition of a *chord* over the bar or accent, *if the bass part moves* into a new form of the chord. This does not necessarily contradict par. 85, for there (and in par. 87) constant stress was laid upon the application of the rule to the repeated **bass tone** only. But this apparent exception now modifies par. 134b, and increases the student’s freedom.

167. Besides the above fundamental directions, there is: a. The more exceptional line of *successive sixths* (par. 156) — which may be used (sparingly) when the melody-tones run smoothly, as successive *roots*; and

b. The couplet 6-5 or 5-6 above the same bass tone (par. 160), which is self-indicating. For example:

Ex. 123.

$I_1$   $II_1$   $III_1$   $IV_1$   $I_1$   $II_1$   $IV_1$   $II_1$   $I_1$   $II_1$

$I_1$   $II_1$   $III_1$   $IV_1$   $I_1$   $II_1$   $IV_1$   $II_1$   $I_1$   $II_1$

\*1) This note is harmonized with a triad, to avoid too long a line of 6ths.

\*2) Observe that the successive 6ths are applied where the melody runs smoothly, and that the line usually begins and ends with a fairly strong chord. — \*3) Here the sixth scale-step is harmonized with the  $II_1$ , because it is evident from the slur and wide leap that the whole beat is one chord. See par. 168.

HARMONIZING SUCCESSIVE TONES TOGETHER.

168. If an *accented* melody-note and the following tone or tones represent the same chord, they may be slurred, as follows, and harmonized together:

Ex. 124.

I — V I IV<sub>1</sub> IV V — I V — VI IV V — I

\*<sub>1</sub>) The *b* and *g* cannot be slurred in this case because they together represent the IV, which does not follow the V.  
 — \*<sub>2</sub>) Whether the chord is merely *held* (as in the 1st meas.) or repeated in a different form, is of no consequence; the principle is the same.

169. *a.* This principle applies particularly to *rapid* melody-notes which result from the division of a beat, as seen in Ex. 123, Note \*<sub>3</sub>). Such rapid notes, *when they belong to the same beat* (or group of beats), are very often intervals of the same chord, especially when they *skip*, and not only may but *should* be harmonized together. Thus:

Ex. 125.

*Allegretto.* FAISSÉ

I — II — V (IV?) V \*<sub>2</sub>) V — I II — V I<sub>1</sub> V I

\*<sub>1</sub>)

\*<sub>1</sub>) Like Ex. 124, Note \*<sub>1</sub>); it should be VI-IV<sub>1</sub>. — \*<sub>2</sub>) See par. 166, and 87*b*.

*b.* When the rapid notes (within a beat) are *diatonic*, they cannot belong to the same chord, and the treatment will conform to Ex. 123*b*, — second beat of measures 1 and 2, and measure 3.

FUNDAMENTAL PRINCIPLES.

A chord of the sixth is most commonly used when the root is in soprano.

A chord may be repeated over the bar, or accent, if the *bass tone* is changed.

Rapid notes, in the same beat, are apt to be harmonized with the same chord, or same bass tone.

EXERCISE TWENTY-TWO.

Add bass and inner parts to Exs. 122, 123, 124 and 125; and to the following melodies, using triads and chords of the sixth. See par. 242.

*a.* \*<sub>1</sub>) *b.* *c.* *d.*

The musical score consists of six staves of music. The first staff begins with a treble clef, a key signature of one sharp (F#), and a 4/4 time signature. It features a melodic line with an accent on the first note and a dynamic marking of *e.* (pizzicato). The second staff continues the melody with a dynamic marking of *f.* and a key signature change to two flats (B-flat major). The third staff has a dynamic marking of *h.* and a key signature of two sharps (D major). The fourth staff has a dynamic marking of *z.* and a key signature of two flats (B-flat major). The fifth staff has a dynamic marking of *z.* and a key signature of two sharps (D major), with the instruction "FAISST" above it. The sixth staff continues the melody with a key signature of two sharps (D major). Various notes and phrases are marked with asterisks (\*1) through (\*10) for reference.

\*1) Par. 166. — \*2) 167a. — \*3) *Invert* the IV, after the V (par. 147a). — \*4) Par. 169a. — \*5) Probably V-I, with successive 5ths in soprano; they are rectified by inverting the second chord (par. 147c). — \*6) Par. 167b. — \*7) Note the slur. This is not treated as in par. 167b. — \*8) 169a. — \*9) Like Ex. 124, Note \*1). — \*10) Par. 137.

### SECTION 3. THE SIX-FOUR CHORDS.

170. See Ex. 102. These inversions stand upon the *chord-fifth*, as shown in par. 141. The quality of this chord-interval, as defined in par. 69c, is most apparent, and exerts the greatest influence upon the harmony, when it lies in the *bass part*, — the chief function of which is to support the harmony. Consequently:

171. a. Six-four chords are not employed *independently*, but must be placed in certain connections with other and stronger chords, as **Embellishing** or as **Passing** chords.

b. They can not occur in direct succession, because of the successive *chord-fifths in bass*, which are far weaker than successive positions of the fifth (comp. par. 76b).

c. They can neither enter nor progress with a skip (in the bass part, of course).

d. For this reason, also, they are not classified, like triads and chords of the 6th, as "principal" and "subordinate" chords. The only distinction that can or need be made is as follows:

EX. 126. C major.

I<sub>2</sub>    IV<sub>2</sub>    II<sub>2</sub>    III<sub>2</sub>    V<sub>2</sub>    VI<sub>2</sub>

\*1) See Ex. 103, Note \*1).

\*2) The I<sub>2</sub>, when accented (as is commonly the case), is semi-independent. The IV<sub>2</sub> is also a fairly strong chord. The rest are all dependent, and seldom occupy accented beats. The V<sub>2</sub> is weaker than might be expected.

172. a. The soprano-position of a six-four chord does not enter into consideration, being always regulated by the chord with which it chances to be connected. The soprano usually has either the interval 6 or 4 (third or root of the chord), — rarely the duplication of the bass tone.

b. The *bass note is almost always doubled* (as intimated, usually in an inner part, — not often in soprano).

THE CONNECTIONS OF SIX-FOUR CHORDS.

FIRST CONNECTION.

173. In general, the six-four chords appear in three different connections with other chords.

First: A 6-4 chord may *enter from*, or *progress to*, the triad upon the *same bass note*.

The following example illustrates the  $I_2$  in this connection. See, again, par. 75.

Ex. 127.  $I_2$

\*1) Major and minor. — \*2) The figures  $\frac{5}{3}$  denote the triad, and are necessary on account of the figures  $\frac{6}{4}$  which accompany them during the same bass tone. As seen in measures 1 and 2, the soprano usually takes either the melodic line 565 or 343 (but compare the last three measures), and the bass tone is doubled in one of the inner parts; wherever the 6th is, the 5th will follow it (as in Ex. 117), and, similarly, the 4th is followed by the 3rd. — \*3) An unusual arrangement of the bass figures, as here, serves to indicate the course of the upper lines.

174. This connection of the six 6-4 chords is not allowed in the following rhythm:

on account of the repetition of the *bass tone* over the bar. (Comp. par. 166.)

175. Not all of the six 6-4 chords can appear in this connection. The following table shows that, besides the  $I_2$ , only the  $IV_2$ ,  $II_2$  and  $VI_2$  can be connected with the triads of their respective bass notes. With the  $V_2$  and  $III_2$  it is impossible.

The  $IV_2$       The  $II_2$       The  $VI_2$       The  $V_2$       The  $III_2$

Ex. 128.

\*1) The  $V_2$  can not be used in this connection on account of the false melodic progressions involved (Ex. 16-6). — \*2) With these accidentals the 6-4 chord is not a  $V_2$ , but the  $I_2$  of G major or minor. — \*3) Here it is a  $IV_2$  in D minor. — \*4) There is no legitimate triad upon the bass note of the  $III_2$  (par. 53).

176. The connection of a 6-4 chord with the *chord of the 6th* upon the same bass note is possible, but rare. It is most common in rapid rhythm, as in Ex. 117.

Ex. 129.

IV<sub>2</sub>                  I<sub>2</sub>                  II<sub>2</sub>                  VI<sub>2</sub>

\*1) The line denotes that the corresponding tone is to be held.

SECOND CONNECTION.

177. **Second:** A six-four chord may appear in connection with any chord of the same root.

I<sub>1</sub>    I<sub>2</sub>    I

This is merely *chord-repetition*, therefore all the rules are nullified, even par. 171c. All of the 6-4 chords can be used in this way. For example:

Ex. 130.

*Allegro*

I    V    VI    III    IV    II    V    I

\*1)    \*2)    \*3)    \*4)

\*1) This example is a *continuous* 8-measure phrase, and not separate measures. — \*2) As the bass part moves from one chord-interval to another, it constitutes occasionally a 6-4 chord, as here. — \*3) The momentary incompleteness of the chord is of no consequence in rapid rhythm. — \*4) These lines, beneath a *moving* bass, indicate chord-repetition; the upper parts are held.

178. It need not be inferred from the above example that the 6-4 chords in this 2nd connection must necessarily be short. They frequently occupy *full* beats. See Ex. 131b; Ex. 135.

The following extracts illustrate Connection one (at *a*) and Connection two (at *b*):

## FUNDAMENTAL PRINCIPLES.

Six-four chords are weak.

They can occur, legitimately, only in connection with chords of the same bass tone, same root, or neighboring bass tone.

The soprano-position is optional. The *bass tone* is doubled.

It is unrhythmical to repeat a *bass tone* over the bar, or accent.

## EXERCISE TWENTY-THREE.

\*1) Any unusual arrangement of the bass figures, as here, serves merely to indicate the course of the upper part or parts. Comp. Ex. 127, Note \*3).—\*2) Par. 87*b*. —\*3) Hold the upper tones. —\*4) The position of a chord is reckoned from the *root* (par. 145*d*). —\*5) The line through the figure 6 signifies that the corresponding note is *raised* by an accidental; it refers, here, to the leading-tone *c*♯. Comp. Exercise 10. —\*6) Rhythm —\*7) Analyze every bass, with reference to the manner in which each 6-4 chord enters and progresses.

**182.** It has been seen in the above examples that these three connections, when possible at all, can be applied equally well *before* or *after* the 6-4 chord. Hence it is obvious that the connections may be associated, so that the 6-4 chord enters in one manner and progresses in another. In this way certain characteristic groups arise, according to the preference which the separate chords evince for certain connections.

**183.** One of the commonest forms results from introducing the six-four chord as *repetition*, and leading it into the triad upon the *same* bass tone. Thus:

184. In this group the 6-4 chord almost always occupies the *accented beat* (or accented fraction); and it represents the same kind of intercepting chord as was seen in Ex. 133. For example:

The  $I_2$     The  $IV_2$     The  $II_2$     The  $VI_2$

Ex. 135.

\*1) It is a little more usual to retain the same soprano note in the 6-4 chord (as in Nos. 1 and 2) than to exchange voices (as in No. 3). — \*2) The  $V_2$  and  $III_2$  are not feasible (par. 175).

185. This rhythmic location of the repetition confirms par. 166.

186. a. A 6-4 chord when occupying an *accented beat* evinces a decided preference for the progression into the triad upon the *same bass tone*, no matter in which connection it was introduced; probably because an *accented bass tone* impresses the mind as a harmonic index, and urges to become a root.

When a 6-4 chord is *unaccented*, it matters but little in what connection it enters and progresses.

b. This progression is most common, and nearly obligatory, with the *tonic* 6-4 chord ( $I_2$ ), which, when *accented*, almost always moves into the V.

But it is not obliged to make the progression *at once*; sometimes a number of chords in the other connections (same root or neighboring bass tone) intervene. Thus:

$I_2$  — V     $I_2$  — V     $I_2$  — V     $I_2$  — V     $I_2$  — V

Ex. 136.

EXERCISE TWENTY-FOUR.

\*1) Ex. 135, Note \*1). — \*2) The Plagal cadence. See par. 187. — \*3) The rhythm in bass, in the first two measures, is irregular, the heavier note occupying the lighter beat (par. 5). It is justified by its recurrence in the second measure. See par. 261. — \*4) This is the actual cadence-beat of the phrase; but instead of being the I, it is its relative, the VI. The expected perfect cadence is therefore evaded, or transformed into a so-called Deceptive cadence, and two measures had to be added to the phrase, in order to regain the perfect cadence. — \*5) Par. 157. — \*6) Par. 162. — \*7) The soprano note is held. — Analyze every bass, as in the preceding exercise.

To this exercise add a number of **Original phrases**.

### THE PLAGAL CADENCE.

**187.** The plagal cadence is a short succession of chords (generally not more than two) added to the perfect cadence, to make the latter less abrupt. To prevent the effect of the perf. cad. from being counteracted, it is necessary to retain the tonic note in soprano (or both soprano and bass) during the plagal ending. Therefore the latter must consist of such chords as contain the tonic, *i.e.*, the IV or VI. The most common of these is the IV. Like all cadences, it must close upon an accent, and for this reason it can appear only in compound measure (par. 3*b*), the perfect cadence falling on the primary accent, and the plagal cadence upon the secondary one (par. 3*d*).

### SIX-FOUR CHORDS AS PASSING CHORDS.

**188.** See par. 171*a*. When an unaccented 6-4 chord enters diatonically, it is apt to progress diatonically also, in the same direction. It then becomes a passing chord, in one of the following three relations:

189. a. **First:** The 6-4 chord appears as diatonic passing chord *between a triad and its first inversion*.

Thus:

Not between a triad and *any* chord of the 6th, but a triad and *its own* sixth. This progression is very common, and may be made in either direction (triad first, or sixth first), in any rhythm, and at any part of the measure, though the 6-4 chord is *generally* unaccented.

b. The soprano usually takes the *same* notes as the bass, but in *contrary* order (Ex. 138-1, 2, 3).

Ex. 138.

\*1) The first 9 measures are the same in major and minor. — \*2) From here on, only in major. — \*3) Ex. 16-1. — \*4) Ex. 16-8. — \*5) All weak chords.

190. a. **Second:** The 6-4 chord becomes a passing chord *between two different chords of the sixth*.

This progression is very good, and is possible in either direction; but it is comparatively rare, because there are so few places in the scale where it is practicable.

b. The soprano generally runs in 6ths parallel with the bass.

Ex. 139.

\*1) Par. 189a, b. — \*2) Exercise 23, Note \*1). — \*3) Exercise 23, Note \*5). — \*4) Par. 190a, b. — \*5) Plagal cadence; rhythm ♩ ♪ ♩. — \*6) Par. 191a, b. — Analyze every bass, as in the foregoing exercise.  
 To this exercise, add a number of **Original phrases**.

EXERCISE TWENTY-SIX.

Transpose (at the piano, at sight) the first of the following examples into all other major keys; and the second, in the same manner, into all other minor and major keys.

Closely observe the positions and the bass figures.

MELODY-HARMONIZING. SIX-FOUR CHORDS.

192. The fundamental chords are defined, as usual, by the scale-steps, according to Ex. 99.

But for the 6-4 chords it is more convenient to single out the *melodic groups* which best admit of this form of chord. These are:

a. The figure with scale-steps 5, 6, 5, — also 3, 4, 3, — 2, 3, 2, — 7, 8, 7, — 1, 2, 1. See Exs. 127, 128.

Ex. 142.

b. Every line of three *diatonic* steps may be harmonized with the *same three steps in bass, in contrary direction*; and a 6-4 chord is always involved. See Ex. 138-1, 2.

Ex. 143.

Discrimination is necessary here. The 6-4 chord is usually in the centre of the group, but not *always*. Review par. 171b.

c. A melody-note, *repeated over the bar or accent*, is very likely to become a 6-4 chord. See Ex. 135.

Ex. 144.

These groups agree partly with Ex. 142.

d. In a "line of 6ths" (Ex. 123a), a *good* 6-4 chord may be substituted for one of the 6ths. But see par. 171b.

Ex. 145.

193. The tonic 6-4 chord is of peculiar importance at both the semi-cadence and the perfect cadence, — in connection with the V. Thus:

Ex. 146.

a. Semi-cadence                      b. Perf. cadence                      \*2)

I<sub>2</sub> V                      I<sub>2</sub> V                      I<sub>2</sub> V I                      I<sub>2</sub> V

\*1) The effect of the I<sub>2</sub> is to lighten and embellish the semi-cadence. — \*2) If the melody-tone just before the perfect cadence calls for the I, it should not be the I itself, but some inverted form, — best, the second inversion.

EXERCISE TWENTY-SEVEN.

See par. 242.

a.                      \*1)                      \*2)                      \*1)                      \*3)

b.                      \*4)

c.                      \*1)                      \*6)                      \*3)

\*5)                      \*2)                      VI

d.                      \*7)                      \*7)

VI                      \*4)                      \*1)

\*7)                      \*8)                      \*3)                      \*1)

\*2)                      \*4)                      \*9)

FAISST

\*1) Ex. 143. — \*2) Par. 193. — \*3) Ex. 146, Note \*2). — \*4) Par. 137. — \*5) Ex. 142. — \*6) Par. 181. — \*7) Ex. 144. — \*8) The two measures beneath each slur represent the same melodic figure. When transferred thus to other (higher, or lower) scale-steps, the reproduction is called a **Sequence**. The same formation is seen in melody *a* (meas. 1, 2), and in melody *e* (meas. 1-3, 5-7). Sequences are usually harmonized uniformly. — \*9) Par. 169a.

## DIVISION B: DISCORDS.

194. A Discord is a harmonic body which contains one or more dissonant intervals.

195. The simplest dissonance is the interval of a **seventh**, which results naturally from adding one higher 3rd to the intervals of the triad. See par. 46a. The result is a four-tone chord, named **chord of the seventh**, after the dissonance which it contains (par. 48).

196. The chords of the 7th are the fundamental four-tone chords, corresponding to the triads, or fundamental three-tone chords. But they can not be classified in the same way as the latter, on account of the obligations connected with their dissonance, in fulfilling which their original independence as fundamental concords is to a certain degree sacrificed.

197. A dissonance has, as the term indicates, a harsh sound which the ear will accept only on condition that it be reasonably brief, and that it be justified by the intervals which precede and (especially) follow it. By itself, a dissonance is meaningless; it demands a progression which will fulfil its obligations. This impression of expectation characterizes the dissonant intervals, and imparts an activity to them which enlivens the harmony,

## THE CLASSIFICATION OF THE DISCORDS.

198. a. The discords are divided into grades or **classes** representing their proportionate degrees of importance and consequent frequency. These classes are determined by the **distance of their roots from the tonic, in ascending harmonic degrees (perfect fifths)**.

Ex. 147.

1st class      2nd class      3rd class      4th class

2nd-dom. Disc.      Submed. Disc.      Med. Disc.

Tonic      Dom. Discords

b. This table shows that there are only *four* fundamental chords of the seventh, or, in other words, discord *classes*. The discords which stand upon the other three steps of the scale (4th, 1st, 7th) are *derived* from these, in a manner which will be seen.

c. The tonic class is not numbered the "first," because it is composed exclusively of concords. No tonic chord can become a discord, without losing its tonic characteristic of repose, and becoming a member of one of the four discord classes.

d. Hence, the **dominant** chords constitute the **first class**, because they rest upon the first perfect fifth above the tonic note. And, similarly, the **second class** have the 2nd perf. fifth above the tonic as fundamental tone, and so on.

e. The third and fourth discord classes are so rare that they hardly enter into consideration in harmony. They are exclusively dissonant.

f. Therefore it is apparent that the tonic class (exclusively consonant) and the 1st and 2nd classes (both consonant and dissonant) represent together virtually the **three elements of the whole system of harmony**. See par. 70.

## THE RESOLUTION OF A DISSONANCE.

199. The progression which satisfies the requirements of a dissonance is called its *resolution*, and the chord which follows a discord is the *resolving chord*.

200. a. Every dissonance in music is resolved **diatonically**, in the majority of cases **downward**.

Ex. 148a. The progression with a skip is *very irregular*, and can be justified only in repetitions.

Ex. 148b.

- b. The dissonance of a chord-seventh should not progress upward: Ex. 148c.
- c. The interval of a 7th should not progress into an octave: Ex. 148d.
- d. No dissonant interval should ever be doubled: comp. par. 69d.

Ex. 148.

201. Dissonances often prove to be a modification of some consonant interval, and the direction of their resolution depends upon the nature of the modification. Augmented intervals have an upward tendency; diminished ones progress downward. The seventh of a chord may be regarded as a depression or contraction of the octave, and therefore it is always resolved downward. The 2nd, as inversion of the 7th, derives its progression from the latter.

Ex. 149.

SECTION I. THE FIRST CLASS OF DISCORDS.

A. THE CHORD OF THE SEVENTH UPON THE DOMINANT.

\*1) Spoken: "Dominant-seventh," or "Five-seven." — \*2) Ex. 102, Note \*1). — \*3) Par. 203b.

202. The chord of the dominant-seventh is obtained by adding another (higher) 3rd to the intervals of the dominant triad. The new interval, the chord-seventh, is the dissonance, requiring resolution. The dominant-seventh is employed in place of, or with, the triad V. The construction and treatment of the chord are the same in minor as in major, with the usual exceptions (Ex. 70).

203. a. There is no choice of position; and the chord-seventh may lie in any part.

b. The chord-fifth may be omitted, and the root doubled.

c. The chord-seventh progresses diatonically downward, and is not to be doubled.

204. a. The resolution of the  $\overset{7}{V}$  into the I (or inversions) will be called **Normal**, because it corresponds to the normal progression (par. 78).

b. The resolution into the VI (the relative of the I) will be called **Deceptive** (par. 119).

c. Both the normal and deceptive resolutions are **regular**, because both lead into tonic chords (par. 100b).

Normal resolution Deceptive resolution

N. B.

Ex. 150. \*1)

7 I 7 7 I<sub>2</sub>  $\frac{7}{4}$   $\frac{7}{3}$  I<sub>1</sub> 7 7 VI  $\frac{7}{8}$  7

\*1) Separate measures, as usual. Alike in major and minor.—\*2) See par. 200c. This error, which may be termed “unequal octaves,” is quite as disagreeable as actual parallel octaves. The error is most obvious in measure 7.—\*3) The parallel 5ths in the inner parts are also “unequal,” because the first one is diminished and the second one perfect. For this reason they are not altogether wrong, as the rule applies strictly only to successive *perfect* 5ths. When the *second* 5th is perfect (as here the *a-e*), the consecutives had, however, better be avoided. The *b* in tenor should ascend to *c*, anyway.

### THE INTRODUCTION OF THE $\frac{7}{}$ .

205. Dissonances should be not only properly resolved, but also so smoothly introduced as to avoid needless harshness.

206. The regular modes of introducing a chord-seventh are:

- a. *Diatonically from above* (i.e., the seventh preceded by the next higher tone);
- b. *Diatonically from below*;
- c. *By preparation* (i.e., preceded by the same tone, as interval of another chord).

207. The introduction with a skip is somewhat irregular, but possible in all chords of the *First class*. Being a tone which resolves downwards, the skip *upward* to it is better than the downward leap (par. 31). For example:

a. Diatonically from above b. From below c. Prepared

Ex. 151. \*1)

8 7 8 7 6 7 8 7  $\frac{8}{4}$   $\frac{7}{3}$  7 7  $\frac{6}{4}$   $\frac{7}{3}$  7 6 7 8 7

d. With skips \*4) \*5)

\*1) In major and minor.—\*2) Also “unequal octaves,” but not quite as bad as the reverse.—\*3) Major only.—\*4) The leap upon the 7th, in parallel direction, and in the outer parts, is harsh. The following measure (soprano and alto) is permissible.—\*5) Par. 207.

FUNDAMENTAL PRINCIPLES.

Discords are divided into Classes, according to the distance of their roots in harmonic degrees above the tonic.

Tonic chords are exclusively consonant.

The seventh of a chord is resolved diatonically downward, and is not doubled

The fifth may be omitted, in chords of the 7th.

Unequal octaves are wrong. Unequal 5ths are doubtful when the second one is perfect.

The introduction of a 7th is regular when it enters diatonically, or is prepared.

All reasonable licences are permissible in First-class chords.

EXERCISE TWENTY-EIGHT.

A. Write out the  $\overset{7}{V}$  of every major and minor key, with its two resolutions, on one staff, as follows:

B. Transpose (at the piano, at sight) the following fragment, into every major and minor key:

C. Add the upper three parts to the following basses, — each chord complete, in succession, as it is no longer practicable to define the soprano alone.

G major  $\frac{3}{8}$  I | I<sub>1</sub> I<sub>2</sub> V I I<sub>1</sub> | II<sub>1</sub> IV VV | VI I<sub>1</sub> II<sub>1</sub> | V I<sub>2</sub> V | I<sub>1</sub> IV I<sub>1</sub> V<sub>2</sub> I | IV<sub>1</sub> I<sub>2</sub> IV | V I<sub>2</sub> V V | I ||

\*1) Par. 189b. — \*2) Chord-fifth omitted. — \*3) Par. 193. — \*4) Ex. 151d-2. — \*5) Exercise 23, Note \*1). — \*6) The upper parts may all be held. — \*7) Ex. 140.

D. To this exercise add a number of **Original phrases**.

THE INVERSIONS OF THE DOMINANT-SEVENTH-CHORD.

208. All chords are inverted in the same manner, *i.e.*, by substituting some other chord-interval for the root, *in bass* (par. 141). A chord of the 7th (4-tone chord) has, obviously, three inversions, as follows:

- 1st inversion, } as before { with the *third* in bass;
- 2nd inversion, } { with the *fifth* in bass;
- 3rd inversion, with the *seventh* in bass.

The inversions are figured and named according to par. 142. Thus:

	Chord of the seventh	Chord of the six-five	Chord of the four-three	Chord of the second
--	----------------------	-----------------------	-------------------------	---------------------

\*1) As usual, those figures which are understood, are generally omitted. — \*2) The pair of adjacent notes always represent the intervals 8 and 7, that is, root and seventh; thus:

In other words, the *upper of these two tones is the root*, and consequently defines the chord. Therefore, the names of the three inversions merely indicate the intervals from the bass note to this pair of tones:  $\frac{6}{7}$ ,  $\frac{5}{7}$ , and 2. — \*3) Spoken: "Five-seven-one"; first the *name* of the chord, then its species, and lastly the number of its inversion. — \*4) In minor, fuller figuring is necessary, on account of the leading-tone, which has an accidental.

209. The inversions appear, as usual, in place of the fundamental chord. The second inversion, like the 6-4 chords, is weak, but *not as much so* as the latter. The third inversion is beautiful and useful.

210. The inversions are treated, in general, like the chord of the seventh. The exceptions are:

- a. *No interval should be omitted* (par. 146c);
- b. The inversions are *limited almost entirely to the normal resolution* (into the I and I<sub>1</sub>).

The deceptive resolution (into the VI) is very rare in the first inversion, *impossible* in the second and third.

Review par. 206.

Normal resolution

206a

206c

206b

207

Ex. 153. \*10)

Deceptive resolution

\*1) The figuring  $\overset{6}{\underset{5}{6}}$  equals  $\overset{6}{\underset{5}{6}}$ , the interval 6 being doubled. — \*2)  $\overset{6}{\underset{4}{3}}$  equals  $\overset{6}{\underset{4}{3}}$ , the interval 4 being doubled. — \*3) These unequal 5ths are perfectly good, because the *second* one is not perfect. — \*4) Either the I or I<sub>1</sub> may follow the 4-3 chord; but the I is better, as it avoids the duplication of *e*. — \*5) Like Ex. 98-3. — \*6) Obviously only the I<sub>1</sub> can follow the third inversion, as resolution of the chord-seventh in bass. — \*7) The unequal 5ths, though doubtful, are not as noticeable *in alto and bass* as in any other two parts. — \*8) Wide leap in bass; comp. par. 171c. — \*9) Succession of weak chords. — \*10) In minor as well as major, excepting where the 6th scale-step ascends to the seventh (Ex. 70).

Further illustrations of the V and inversions:

BEETHOVEN

BEETHOVEN

Ex. 154.

A  $\overset{7}{V}_3$  I<sub>1</sub>  $\overset{7}{V}_2$   $\overset{7}{V}_1$   $\overset{7}{V}$  I IV<sub>1</sub> I<sub>2</sub> IV I<sub>1</sub>  $\overset{7}{V}_2$  I V<sub>1</sub>  $\overset{7}{V}_1$  I II<sub>1</sub> I<sub>2</sub>  $\overset{7}{V}$  I

211. The rule of par. 85, concerning the repetition of a *bass tone*, is subject to an exception, as follows: An unaccented bass tone may be repeated over the bar or accent, *if it becomes a dissonance*. Thus:

Ex. 155.

FUNDAMENTAL PRINCIPLES.

In an inversion, no chord-interval is omitted.

The deceptive resolution is applied *only* to the  $\overset{7}{V}$ , — not to its inversions.

A *chord* may be repeated over the bar, if its bass changes; a *bass tone* may be repeated over the bar, if it becomes dissonant.

EXERCISE TWENTY-NINE.

A. Write out the  $\overset{7}{V}_1$  of *F, G, B $\flat$ , D, E $\flat$ , A, E, A $\flat$ , D $\flat$ , B, G $\flat$  majors*; the  $\overset{7}{V}_2$  of *e $\flat$ , g $\sharp$ , b $\flat$ , f, c $\sharp$ , f $\sharp$ , c, b, g, e, d* minors; and the  $\overset{7}{V}_3$  of *G, F, B $\flat$ , D, A, E $\flat$ , A $\flat$ , B, E, D $\flat$ , F $\sharp$  majors*, — with their resolutions, on one staff, as follows:

Afterwards, find these same chords and their resolutions *at the piano*, with the right hand alone, without reference to the table.

B. Bases. (The position-figures may be ignored.)

a.

b.

c.

d.

\*1) Positions are reckoned from the root. — \*2) Par. 123a. — \*3) Ex. 153, Note \*1). — \*4) Ex. 153, Note \*2). — \*5) The upper parts are held.

C. To this exercise add a number of **Original** phrases.

IRREGULAR RESOLUTIONS OF THE DOMINANT-7TH-CHORDS.

212. The majority of licences in the treatment of dependent chords and intervals appear at **repetitions**, where, as has been shown, all rules are suspended.

213. The licences which attend *chord-repetition* are of two general classes, namely:

- a. The resolution of the active tone itself is *deferred*, by the interposition of some other interval or intervals of the *same chord*;
- b. The active tone is *transferred* to another part, and there resolved. These all constitute “modified repetition.”

214. a. Hence, *when the chord remains the same*, any *convenient* interval or intervals may be interposed between the chord-seventh and its resolving-tone. (Deferred resolution.)

b. When the chord is repeated, it may change its form, its position, and the disposition of its intervals to any reasonable extent; the seventh is likely to be *transferred* from one part to another without any other restriction than this: being a tone with downward tendency, it is most apt, even when the chord remains the same, to progress to a *lower tone*.

c. In all of these deferred resolutions the seventh is ultimately resolved *in the part where it last appeared*.

Ex. 156.

*a.* Deferred resolution *b.* Transferred dissonance

\*1) Major and minor. — \*2) The 7th moves upward; but in reality the *g* is only an interposed interval of the same chord, and does not interfere with the ultimate resolution into *e*. — \*3) Here another form of the chord intervenes, before the resolution takes place. — \*4) The 7th is transferred from the alto to the soprano, and is resolved in the *latter* part. — \*5) The 7th in soprano, though transferred to the bass and resolved there, should progress *downward* to *d* or *b*, and not upward. The following measure is better, because the 7th in tenor is taken up by the bass in the same register. — \*6) Here the chord-seventh disappears altogether for a moment.

### THE PASSIVE RESOLUTION.

215. Another kind of licence is a Digression or Indirect resolution, which consists in interposing a *foreign chord* before the resolution takes place. It is another form of “deferred” resolution, but less common than that of modified repetition. The foreign chord must be reasonably *brief*, and must be in some way connected with the discord whose progression it interrupts.

216. *a.* The foreign chords which intervene between the  $\overset{7}{V}$  and its regular resolving-chords are the two subdominant or **second-class** chords IV and II, in both of which *the seventh of the dominant occurs as consonant chord-interval*, thus constituting a connecting-link. For example:

$\overset{7}{V}$    IV    $\overset{7}{V}$    II

*b.* This chord-progression may be termed a **Passive resolution**, because the 7th, in becoming a consonant interval, is actually resolved, passively, through the other parts. It corresponds to Exs. 67 and 79, but is more feasible, because of the connective link which the seventh provides.

217. The consonant condition thus gained by the 7th does not compensate for the actual regular resolution. Hence:

*a.* The passive resolution is usually only a digression from the discord and directly back to it (perhaps in a new form); thus:  $\overset{7}{V}$ -(IV or II)- $\overset{7}{V}$ : or  $\overset{7}{V}$ -(IV or II)- $\overset{7}{V}_1$ , or  $\overset{7}{V}_2$ . Compare Ex. 67, Note \*2).

b. Much more rarely, it is interposed *between the discord and its resolving-chords*; thus:  $\overset{7}{V}$ -(IV or II)-I, or VI.

c. Rule I. The seventh must *remain stationary, i. e.*, in the same part.

d. Rule II. The seventh should not be *doubled*, or otherwise disturbed, during its transient *consonant* condition.

Ex. 157.

Passive resolution

Incorrect

Exceptional

Rule I

Rule II

\*1) Par. 217a. — \*2) 217b. — \*3) The 7th must remain in the same part *when the harmony changes*. Par. 217c. — \*4) The *f* in alto is wrong, because it doubles the passive seventh. Par. 200c. — \*5) These measures, in which the passive 7th changes parts, are exceptional, but admissible, because the tone remains in the same register. — \*6) Major only. — \*7) Major and minor.

OTHER IRREGULAR RESOLUTIONS.

218. Besides the above licences there are two other irregularities which are peculiar to the chord of the dominant-seventh:

a. The 7th may be resolved diatonically *upward*, when the bass part moves *parallel with it, in 3rds*; and

b. The seventh may be *doubled*, when one seventh progresses to another chord-interval before the other is resolved. Thus:

Ex. 158.

a. Ascending resolution

b. Doubled seventh

\*1)

\*2)

\*3)

$\overset{7}{V}_2$   $I_1$

$\overset{7}{V}$   $\overset{7}{V}$

\*1) Major and minor. — \*2) This licence is limited to the chords  $\overset{7}{V}_2 - I_1$ ; in no other case would the bass move with the ascending 7th, in parallel 3rds. It is not to be confounded with the first measure of Ex. 156, where the 7th

progresses upward, but *returns* to its resolving-tone. — \*3) These 5ths are allowed. They are unequal; and they seem to be fully disguised by the parallel movement of each part with the bass (comp. par. 66).

---

FUNDAMENTAL PRINCIPLES.

When the dom. discord is *repeated*, it may change its form in any reasonable manner, deferring the resolution, if desired.

The passive resolution of dom. discords is effected by Second-dom. chords, the chord-seventh *remaining stationary*.

The seventh of the dom. chord may be resolved diatonically upward when the bass accompanies it in parallel thirds.

---

EXERCISE THIRTY.

A. Basses. (The positions may be ignored.)

The exercise consists of six staves of music, each containing a sequence of bass clef notes with chord symbols and fingerings. The notation includes various intervals and chord structures, often with accidentals and dynamic markings.

- Staff 1 (a):** Starts with a C major chord (7<sup>5</sup> \*1) and moves through several chords including G major (3), F major (3), and D major (3). It ends with a G major chord (7<sup>5</sup> \*2).
- Staff 2 (b):** Starts with a G major chord (5) and moves through F major (3), E major (3), and D major (3). It ends with a G major chord (7<sup>5</sup> \*3).
- Staff 3 (c):** Starts with a G major chord (7) and moves through F major (7), E major (3), and D major (3). It ends with a G major chord (7<sup>5</sup> \*4).
- Staff 4 (d):** Starts with a G major chord (7) and moves through F major (7), E major (3), and D major (3). It ends with a G major chord (7<sup>5</sup> \*5).
- Staff 5 (e):** Starts with a G major chord (7) and moves through F major (7), E major (3), and D major (3). It ends with a G major chord (7<sup>5</sup> \*6).
- Staff 6 (f):** Starts with a G major chord (7) and moves through F major (7), E major (3), and D major (3). It ends with a G major chord (7<sup>5</sup> \*7).

\*1) Ex. 156b. — \*2) As usual, the rows of figures indicate the course of the upper parts. — \*3) Par. 217c, d. — \*4) Par. 218b. — \*5) Par. 218a.

B. Play the following chord-progressions *slowly*, at the piano, in different major and minor keys. At first with the right hand alone; afterwards with both hands, the bass alone in the left hand:

$$\overset{7}{I}-\overset{7}{V}-\overset{7}{V_2}-\overset{7}{I_1} \parallel \overset{7}{V_2}-\overset{7}{V_3}-\overset{7}{I_1} \parallel \overset{7}{V_1}-\overset{7}{V}-\overset{7}{VI} \parallel \overset{7}{V}-\overset{7}{I_2}-\overset{7}{V_3}-\overset{7}{V_2}-\overset{7}{I} \parallel \overset{7}{V}-\overset{7}{IV_1}-\overset{7}{V}-\overset{7}{I} \parallel$$
 Major only  

$$\overset{7}{(V_1-II_2-V-VI)} \parallel \overset{7}{V_2-IV_2-V_1-I} \parallel \overset{7}{V_3-IV-V_3-I_1} \parallel \overset{7}{V-IV_1-VI} \parallel$$
 Major only  

$$\overset{7}{V_1-IV_2-I} \parallel \overset{7}{(V-II_2-VI)} \parallel \overset{7}{V-IV_1-I_2-V-V_3-I_1} \parallel$$

C. A number of Original phrases.

B. THE INCOMPLETE CHORD OF THE DOMINANT-SEVENTH,  
or, the triad upon the leading-tone.

219. a. The root is the interval upon which the identity of a chord naturally depends; but when the other chord-intervals are of such a nature that they define their chord beyond a reasonable doubt *without the root*, the latter may be omitted without obscuring the harmony.

b. This is naturally not often the case in *three-tone* chords, but is not unusual in those of *four tones*, and almost obligatory in those with *five*. When applied to the chord of the dominant-seventh the result is as follows:

Ex. 159. or Inversions Figuring Positions

\*1) Spoken: "Five-seven, incomplete." The term "Incomplete" in this book invariably signifies "*without the root*," and is indicated by the o. The inversions are not reckoned from the *actual* root, but, for convenience, from the *apparent* root (the third of the fundamental chord). — \*2) The positions, also, are reckoned from the lowest tone of the *triad*, as in ordinary chords.

220. a. The incomplete  $\overset{7}{V}$  is the triad upon the leading-tone (par. 53), with its inversions.

b. Like the  $\overset{7}{V}$  itself, it is alike in form and treatment in major and minor.

c. It is a *diminished triad*, because its fifth is diminished, and therefore a discord, though but a 3-tone chord. The diminished 5th is the dissonance (par. 40e).

221. The reasons why this chord must be regarded as a derivative of the  $\overset{7}{V}$ , instead of as an independent chord with the corresponding designation (VII), may be demonstrated as follows:

1, because it contains the leading-tone, the chief characteristic of the dominant harmonies, as *apparent* harmonic basis (par. 73a);

2, because its most natural progression (resolution) is into the I and VI, exactly like the  $\overset{7}{V}$ . This is naturally owing to the tendency of its leading-tone, and to the coincidence of its dissonance (the dim. 5th) with the dissonance of the  $\overset{7}{V}$ ;

3, because the comparison of this chord with the  $\overset{7}{V}$  discloses a similarity of effect not to be found or expected between *different* chords.

222. a. The dissonance, being no longer an *actual* 7th, is not obliged to resolve diatonically downward, but may (especially when approached from below) progress *diatonically upward*.

b. Either the 3rd or 5th of the triad may be doubled. When the latter (the dissonance) is doubled, the two tones generally move in opposite directions.

c. The best and *far most frequent* form of this dim. triad, is *the chord of the sixth*. The *triad itself* is rarely used, because of the prominence of the dim. 5th. The 6-4 chord is better than the triad, and stronger than other (consonant) 6-4 chords, and occurs in the usual three connections (par. 173, etc.).

d. The resolutions correspond to those of the  $\overset{7}{V}$  complete, *i.e.*, *normal*, into the I (I<sub>1</sub>); *deceptive*, into the VI; *passive*, into the IV and II. For example:

a. Chord of the 6th ( $\overset{7}{V}_1$ )

EX. 160.

b. The triad ( $\overset{7}{V}$ )

c. The  $\frac{9}{4}$  chord ( $\overset{7}{V}_2$ )

\*1) The 3rd scale-step is very often doubled in connection with these incomplete chords, as it conduces to smooth progression. — \*2) The leading-tone may be thus doubled, when the two tones progress *diatonically in contrary motion*, as here. — \*3) This skip from the dissonance (*f*) is justifiable in any part but soprano. — \*4) Par. 162. — \*5) The unequal 5ths in bass and alto are barely excusable. — \*6) Par. 191a, b. — \*7) The skips in bass from the dissonance, in this measure and the next, are irregular and unusual, but excusable on the ground of par. 222a, and the quality of *f* as a principal tone of the scale. — \*8) The two successive 6-4 chords (contrary to par. 171b) are allowed because one is the I<sub>2</sub> (Ex. 126), and the other a *discord* (par. 222c). — \*9) See Ex. 118, No. 6; also par. 137.

### THE II IN MINOR.

223. This is also a diminished triad, and consequently a discord. It belongs properly to the 2nd Class of chords, as its root is the second-dominant (Ex. 147), therefore its treatment at this place is premature, but justified by its importance. It resembles the incomplete V in general character and treatment. In structure it corresponds of course to the major II:

C minor

d.

B. Minor.

e.

f.

g.

\*1) Ex. 159, Note \*2). — \*2) Ex. 140. — \*3) The upper parts are held. — \*4) Par. 123a. — \*5) Par. 162. — \*6) Plagal. (Rhythm ♩ ♩ ♩). — \*7) Par. 157. — \*8) Deceptive cadence.

C. Original phrases.

MELODY-HARMONIZING. DOMINANT-SEVENTH.

225. The dominant discords appear naturally as substitutes for the concord. Therefore, the dom.-seventh chord may be used for any scale-step contained in the V. Thus:

Steps:

Ex. 162.

V or  $\overset{7}{V}$  V or  $\overset{7}{V}$  V or  $\overset{7}{V}$

The *inversion* depends upon circumstances, but is easily determined.

226. Further, the dom.-seventh chord may now be used in harmonizing the *fourth scale-step*. This has hitherto been harmonized with the second-dominant chords (IV or II), and these will still be necessary when the 4th step *ascends*, or makes any other movement antagonistic to its resolution as *chord-seventh* of the dominant. For example:

Ex. 163.

$\overset{7}{V}$  { I VI  $\overset{7}{V}_1$  I  $\overset{7}{V}$   $\overset{7}{V}$   $\overset{7}{V}$   $\overset{7}{V}$   $\overset{7}{V}$   $\overset{7}{V}$  I  $\overset{7}{V}$  IV

$\overset{7}{V}_2$  I<sub>1</sub> or Inv. \*3) or Inv. ⊕ ⊕

\*1) \*2)

\*4) \*5) \*6)

$\overset{7}{V}_2$  I<sub>1</sub> or Inv.  $\overset{7}{V}$  V IV  $\overset{7}{V}$  IV<sub>1</sub>  $\overset{7}{V}_1$   $\overset{7}{V}$  IV<sub>1</sub> VI I<sub>2</sub>

\*1) Not the  $\overset{7}{V}_3$ , because the seventh cannot be doubled in bass and soprano. — \*2) Not the VI; see par. 210b. — \*3) Good, if the *bass note* changes. — \*4) This is the one possible case where the *ascending* 4th step may be harmonized with a dom. discord; but it is rare; see Ex. 158a. — \*5) Ex. 156a. — \*6) Passive resolution.

227. The Incomplete dom.-seventh may be used for the 7th, 2nd and 4th scale-steps, but is chiefly used for the 7th step, which it harmonizes with the chord of the 6th. Thus:

Ex. 164.

Steps: 7 8 6 7 7 6 7 4 3 4 5 2 3 2 1

Bass: 6 5 6 6 6 6 5 6 6 6 6 6 6 6 6 6 6 6 6

\*1) This demonstrates the usefulness of the incompl. dom.-7th, in the case of these irregular melodic successions.

EXERCISE THIRTY-TWO.

See pars. 242, 243.

\*1) Par. 226. — \*2) Ex. 144. — \*3) Par. 225. — \*4) Passive resolution. — \*5) Ex. 164. — \*6) Ex. 163, Note \*4). — \*7) Par. 227. — \*8) Ex. 143. — \*9) Successive 6ths. — \*10) Ex. 146, Note \*2). — \*11) It is better *not* to use the discord of the dominant, as semi-cadence chord, but the simple V. — \*12) Same chord, unchanged, for the repeated notes. — \*13) Ex. 118-2.

C. THE CHORD OF THE NINTH UPON THE DOMINANT.

228. a. This five-tone chord is obtained by adding another higher third to the intervals of the  $\overset{7}{V}$ .

b. The new interval is a *ninth* from the root, and its most important characteristics are:

1st, that, being related most directly to the seventh (upon which the last third is erected), it must always be *at least 9 tones (7+3) from the root*, and therefore *can never be contracted to a 2nd*. Thus:

2nd, that it cannot appear *without the seventh*. Consequently,

c. The chord-fifth must be omitted in 4-part harmony; not the seventh, nor the third. No interval can be doubled.

229. This is the first dominant chord which differs in major and minor. In major it has a *major ninth*, in minor a *minor ninth*. Hence, a distinction is made in its treatment in the two modes as follows:

a. In **major**, the ninth should always be placed **in the uppermost part** (soprano).

b. In **minor**, on the contrary, the ninth may lie in any of the three upper parts; but, as stated above, *never less than a ninth from the root*.

\*1) Spoken: "Five-nine." — \*2) Always figured  $\overset{9}{7}$  on account of par. 228b. — \*3) Par. 228c. — \*4) Par. 229b.

INTRODUCTION AND RESOLUTION OF THE  $\overset{\circ}{V}$ .

230. a. The introduction of the ninth is similar to that of the seventh, as shown in pars. 206, 207.

b. The ninth is resolved exactly like the seventh, **diatonically downward**; or, if a passive resolution, by *remaining stationary*, in the same part. The two dissonances (seventh and ninth) are very commonly introduced and resolved together, in the same manner; but not necessarily.

c. The **normal** resolution is effected by the I ( $I_2$ ). The deceptive resolution is not possible. The **passive** resolution is effected by the  $IV_1$  or  $IV_2$ ; not by the II.

Introduction.

Ex. 166.

\*1) Strict (comp. Ex. 151):

Free :

\*5)

\*1) When the 9th is introduced diatonically from above, the leading-tone moves contrary to its natural tendency. It is chord-repetition. — \*2) A skip of a seventh is hardly possible in any other connection than in chord-repetition, as here. — \*3) Unequal octaves; comp. Ex. 151, Note \*4). — \*4) Par. 207. — \*5) The student must hereafter determine for himself which of the examples are valid for *both major and minor*. The chief obstacle, which defeats minor, is the succession of the 6th and 7th scale-steps, — as in meas. 1, 2, 16 and 17.

Resolution.

Normal: Partial: Passive:

Ex. 167.

\*1) \*2) \*3)

\*1) The 9th is resolved alone. — \*2) This duplication of the stationary 9th (*a* in soprano and bass) is excused by the smoothness of the progressions; but par. 217*d* remains valid. — \*3) Similar to Ex. 133, Note \*2).

**231.** There are a few licences in the resolution of the  $\overset{\circ}{V}$  which are to some extent peculiar to five-tone chords, as follows:

- a. The ordinary deferred resolution (par. 214a), and the transferred dissonance (par. 214b).
- b. The exchange of dissonances.
- c. When one dissonance progresses to another, or, in general, *when any active tone progresses to another active tone, it evades its own resolution, the progression of the last active tone sufficing for both.* It is necessary that the *first* active tone moves in the proper direction, unless it is chord-repetition.
- d. Similarly, an exchange is sometimes made during the passive resolution.

Ex. 168.

\*1) The exchange of the 9th and 7th is possible only in *minor*, for the reason given in par. 229a. See also par. 214c.

\*2) The 9th (*a*) is merged in the 7th, and the resolution of the latter suffices for both. — \*3) The 9th is merged in the *lower* leading-tone and evades its ordinary resolution. The progression *upward* into the leading-tone would, however, be very irregular. It is possible, but demands a different analysis.

In all of these cases excepting the passive resolution the discord is *merely repeated in another form* (par. 212).

FUNDAMENTAL PRINCIPLES.

The chord-ninth must always be at least 9 tones above the root.

The ninth never appears without its seventh.

In *major*, the ninth of the dominant chord must be in *soprano*.

The ninth is introduced and resolved exactly like the seventh.

When one dissonance progresses to another dissonance, or to another sufficiently active tone, the resolution of the latter suffices for both.

EXERCISE THIRTY-THREE.

\*1) Par. 229a. — \*2) Par. 229b. — \*3) As usual, the arrangement of the figures indicates the course of the upper parts. — \*4) Ex. 140. — \*5) Passive resolution. — \*6) Rhythm ♩ —.

To this exercise, add a number of **Original phrases**.

THE COMPLETE INVERSIONS OF THE FIVE-NINE.

**232.** It is obviously impossible to invert the *interval* of a 9th, because it exceeds an octave (par. 42). But, as the inversion of a chord merely affects the *bass part*, it follows that complete inversions of the *chord* of the dom.-9th may be obtained, in the usual manner. But they are peculiar and difficult to handle, on account of the inconvenient 9-tone interval, which can neither be inverted nor contracted (par. 228b). The following example exhibits the possible forms:

\*1) The 2nd inversion can be employed only in five-part harmony, as the 5th (the only omissible interval) lies in the bass itself. — \*2) The 4th inversion, involving an inversion of the nine-tone interval, is an absurdity. — \*3) The resolution of these chords corresponds to that of the Five-nine itself.

D. THE INCOMPLETE CHORD OF THE DOMINANT-NINTH,  
or, the chord of the seventh upon the leading-tone.

**233.** It need not be inferred from the above paragraph that the chord of the dominant-ninth is available only in its fundamental shape. On the contrary, that is the very form in which it is most rarely used, because it is too bulky, and subject to too many restrictions. This is the case with every chord of the ninth; hence the rule:

a. Five-tone chords should, in general, not be used in four-part harmony *in their complete form*, but must be made *incomplete*, by omitting the root. (Review par. 219a, b).

b. The only exception is the  $\overset{\circ}{V}$ , which, by virtue of its superiority as *First-class chord*, is occasionally used complete, — as seen in the preceding exercise.

234. The incomplete Five-nine is the chord of the seventh on the leading-tone (comp. 220a) with its inversions; and it differs in major and minor, like the Five-nine itself (229):

\*1) Spoken: "Five-nine, incomplete," and figured as usual, 7,  $\frac{9}{8}$ ,  $\frac{4}{3}$ , and 2. See Ex. 159, Notes.

THE  $\overset{9}{\underset{7}{V}}$  IN THE MAJOR MODE.

235. The chord of the seventh on the leading-tone is called, *in major*, the "Ambiguous seventh," because it is more suggestive of the relative minor key than of its own major key, and unless carefully handled, with strict regard to the conditions of its key, it causes disagreeable confusion of scales.

This is because it is a genuine chord of the 7th, with every indication that the lowest tone is its actual root. But as it cannot be a root if it is the *leading-tone* (par. 51), the ear assumes this lowest tone to be *some other scale-step*, and therefore in some other key, — namely, the 2nd step of the relative minor. Thus:

In order to hold this chord in its major key (where it is a *chord of the ninth*), and counteract its tendency towards the relative minor (in which it is a *chord of the seventh*), it must be treated like the original "ninth," and not like an ordinary "seventh." The rules are as follows:

236. a. The 7-tone interval from the leading-tone to the ninth represents the original 9-tone interval, thus: therefore this interval, **in major**, should not be inverted (as second). In other words, the dom.-ninth, in major, must never lie below the leading-tone, thus:

b. The most effectual mode of avoiding this error is, *to place the ninth in the soprano* (par. 229a).

c. The major ninth may, it is true, also lie in an inner part; but only when the leading-tone is in some *still lower* part, and when the 9th is introduced strictly.

d. No interval can be *omitted* in these incomplete chords, and consequently none can be *doubled*.

The following table illustrates the manner in which the Incomplete dom.-ninth and its inversions may be erected in major.

Ex. 170.

\*1) These forms are exceptional. See par. 236c. — \*2) Ex. 169, Note \*2).

237. The dissonances (7th and 9th) are introduced as in the complete  $\overset{\circ}{V}$ , but perhaps somewhat more strictly.

Introduction:

Ex. 171. Major.

\*1) When the 9th enters diatonically from *above*, the leading-tone is generally doubled. This is entirely correct in this connection, as it is simply a smooth preparation for the interval 7, — like Ex. 151, meas. 1, 2. — \*2) These parallel 5ths are particularly apt to occur. They are best avoided by *doubling the third of the I*, as seen in the preceding measure. — \*3) Par. 236c.

238. The resolutions, also, coincide with those of the complete  $\overset{\circ}{V}$ , *i.e.*, **normal**, into the I, I<sub>1</sub>; **passive**, into the IV (VI); **deferred**, by other forms of dominant discords.

Resolution:

Ex. 172. Major.

\*1) In the normal resolution, these parallel 5ths are especially troublesome, and must be closely watched. As before, they are generally avoided by doubling the 3rd of the I, as in the next measure. — \*2) Comp. Ex. 167, measures 4 and 5. — \*3) Comp. par. 218a. — \*4) Comp. Ex. 160, Note \*7).

EXERCISE THIRTY-FOUR.

FAISSÉ

The exercise consists of five parts, each on a bass clef staff with a 3/4 time signature. Part a starts with a key signature of one sharp (F#) and contains several measures with annotations like \*1), 3, 5\*2), +6, \*1), \*3), and -3. Part b continues with a key signature change to two sharps (F#, C#) and includes annotations like 75 and +3. Part c has a key signature of two sharps and includes annotations like \*1), +3, \*3), 3, C, +3, -3, +5, 3, 6, and 5. Part d has a key signature of two sharps and includes annotations like +7, \*3), 5, 6, \*4), +9, and -3. Part e has a key signature of two sharps and includes annotations like 8, \*5), +3, +7, 5, and -6. Figured bass notation is provided below the notes in each part.

\*1) Par. 236b. — \*2) The positions are reckoned as in ordinary chords of the 7th, without regard to the actual (omitted) root. — \*3) Ex. 172, Note \*1). — \*4) Par. 236c. — \*5) Rhythm —  
Add a number of Original phrases.

THE  $\overset{\circ}{V}_9$  IN THE MINOR MODE.

239. a. The chord of the seventh upon the leading-tone *in minor* is called the **chord of the diminished 7th**, because it contains that peculiar interval (in C minor,  $b\sharp - ab$ ).

Ex. 173. C minor Figuring:  
The example shows the chord of the diminished 7th in C minor in both treble and bass clefs. The treble clef shows the chord with notes B, D, F, and Ab. The bass clef shows the chord with notes G, Bb, D, and F. Below the notes is the figured bass notation:  $\overset{\circ}{V}_9$ ,  $\overset{\circ}{V}_1$ ,  $\overset{\circ}{V}_2$ ,  $\overset{\circ}{V}_3$ .

b. One of its most significant features is, that the contiguous intervals are all of the same size (at least, on the pianoforte), namely, *three half-steps*. Thus:

Ex. 174. The example shows the intervals of the diminished 7th chord in C minor on a treble clef staff. The notes are B, D, F, and Ab, with arrows indicating the intervals between them, which are all three half-steps. The staff ends with "etc.":

c. Consequently:

All the forms (inversions) of the chord of the dim. 7th *must sound exactly alike*, as they constitute each time a group of "three times three half-steps." (Test at the piano.) It is therefore impossible to distinguish the separate chord-intervals from each other, and the restriction, of the chord-ninth to the soprano (as in major) is needless.

These chords are the most flexible in the whole harmonic system, and accommodate themselves with extraordinary ease and readiness to other chords. For this reason, and because of their great beauty, they are extremely important and useful.

d. The difference in the denomination or *actual* size of the intervals (according to the *letters*) is necessary for the identification of the chord and key. In the above example all the adjacent tones constitute minor 3rds, excepting  $ab - b\sharp$ , which is an *augmented 2nd*, representing the intervals 8 and 7, — see Ex. 152, Note \*2), — and defining the chord-name.

240. The rules are, then, as follows:

a. The disposition of the chord-intervals in the four parts is entirely optional. The ninth may lie in *any part*, even in bass. Otherwise the treatment is about the same as in major.

b. As in major, no interval is to be *omitted*, and none *doubled*.

c. The introduction of the ninth *diatonically from above* is impracticable, on account of the false melodic succession.

d. In the normal resolution, the parallel 5ths are not as bad as in major (Ex. 172, Note \*1), because one of the 5ths is diminished. Still, it is advisable to avoid them, as in major, by doubling the third of the resolving-chord (I).

Introduction: Par. 240a.

\*1) Review par. 75. — \*2) These skips to the leading-tone are good. Par. 31. — \*3) The ninth *in bass* is correct, but rare.

Resolution:

The image shows two systems of musical notation for a piano exercise by Chopin. The first system consists of two staves (treble and bass clef) with a key signature of two flats (B-flat and E-flat). Above the staves are several annotations:  $\overset{9}{\circ}V_2$  above the first measure,  $\overset{9}{\circ}V_3 ?$  above the second measure, and  $*4)$  above the eighth measure. Below the staves are chord symbols:  $I_1$   $*2)$   $I$   $IV$   $z$   $I_2$   $z$   $\frac{4}{3}$   $VI$ . The name "CHOPIN" is written below the second system. The second system also has two staves with similar annotations:  $*4)$  above the eighth measure, and chord symbols  $IV_1$   $I_1$   $*2)$   $I$   $\overset{7}{VI}$   $\overset{9}{V}_0$   $VI_2$   $\overset{9}{V}_0$   $VI_1$   $IV$   $\overset{7}{V}$   $I$ . The time signature  $\frac{3}{4}$  is indicated at the end of the second system.

\*1) Par. 240d. In measure 7 the unequal 5ths are concealed by the inner part. In meas. 8 they are in the outer parts and therefore conspicuous. — \*2) These downward skips from the 7th and 9th are justified by par. 239c. See also Ex. 160, Note \*7). — \*3) See Ex. 175, Note \*3). The normal resolution of the bass ninth, into a 6-4 chord, is very weak. The following measures are better. — \*4) Passive resolution. — \*5) This irregular soprano is permissible, because it is *chord-repetition*. But the part that has the succession should be *on the way upward*. Comp. Ex. 50, Note \*1).

FUNDAMENTAL PRINCIPLES.

Five-tone chords, with the single exception of the dominant-ninth, are not used *complete* in 4-part harmony, but *incomplete* (without the root).

The incomplete  $\overset{9}{V}$  is the chord of the 7th on the leading-tone.

The incomplete  $\overset{9}{V}$  in *major* suggests the relative minor key, and is possible only when the ninth lies *above* the leading-tone.

The major ninth of the dominant is best in soprano.

The incomplete  $\overset{9}{V}$  in *minor* is the chord of the dim. 7th, consisting of equidistant intervals; it is very useful, attractive and easy to connect.

The chord of the dim. 7th and its inversions all sound exactly alike.

The minor 9th in bass is rare.

The First chord-class, or dominant element, embraces the discords  $\overset{7}{V}$ ,  $\overset{9}{V}$ ,  $\overset{7}{\circ}V$  and  $\overset{9}{\circ}V$ , and the concords V and III.

EXERCISE THIRTY-FIVE.

These minor basses are all to be worked out *in a number of different ways (i.e., with different sopranos)*. The given positions may be used for the first solution, but must then be ignored altogether.

The image shows a musical exercise for the bass clef in 4/4 time. The key signature has one sharp (F#). The exercise consists of a single staff with several measures. Above the staff are annotations:  $a.$  above the first measure,  $*1)+7$  above the second measure,  $+8$  above the fifth measure,  $5$  above the sixth measure, and  $-5$  above the eighth measure. Below the staff are chord symbols:  $7$   $7$   $\frac{6}{3}$   $\frac{5}{3}$   $\frac{4}{3}$   $\frac{6}{3}$   $6$   $\frac{11}{7}$   $6$   $\#$   $z$   $\frac{6}{4}$   $\frac{6}{3}$   $6$   $\frac{6}{4}$   $\frac{7}{3}$   $z$   $\#$   $\frac{6}{3}$   $7$   $\#$ . The exercise ends with a double bar line.

The musical score consists of five systems of bass clef notation. Each system contains a melodic line with various intervals and chord symbols. The systems are labeled with letters b, c, d, e, and f. Chord symbols include G, G<sup>7</sup>, G<sup>9</sup>, G<sup>11</sup>, G<sup>13</sup>, and various inversions. Fingering numbers (1-5) are placed above or below notes. Some systems have asterisks (\*1), (\*2), or (\*3) indicating specific techniques or examples.

\*1) The positions are reckoned as usual, from the lowest tone of the chord, without reference to the *actual* root. —  
 \*2) Rhythm ♩ ♩♩ —. \*3) Comp. Ex. 176, measure 4. — \*4) Comp. Ex. 90, Note \*2).  
 To this exercise add a large number of Original phrases.

MELODY-HARMONIZING. DOMINANT-NINTH.

241. The five-nine, as stated, should be used almost altogether in its *incomplete* form; and a distinction must be made as usual between its application in *major* and *minor*.

a. In **major**, it can only be used, safely, in harmonizing the 6th scale-step, when it *descends*. This places the ninth in soprano, and ensures the admissibility of any legitimate inversion (Ex. 170).

b. In **minor**, the  $\overset{\circ}{V}$  (generally incomplete) may be used:

1st, and in general, *wherever the  $\overset{\circ}{V}$  and its inversions are possible.*

2nd, and in particular, as in major, in harmonizing the 6th scale-step (descending).

For illustration:

Ex. 177. Major and minor Minor Maj. and minor  
 Ex. 177.  $\overset{\circ}{V}$  { I I<sub>2</sub>  $\overset{\circ}{V}$  - I  $\overset{\circ}{V}$  } { (I)  $\overset{\circ}{V}$   $\overset{\circ}{V}$   $\overset{\circ}{V}$   $\overset{\circ}{V}$   $\overset{\circ}{V}$   $\overset{\circ}{V}$  }  $\overset{\circ}{V}_o$   $\overset{\circ}{V}_o$   $\overset{\circ}{V}_o$  IV  $\overset{\circ}{V}_o$   $\overset{\circ}{V}_o$  IV  $\overset{\circ}{V}$   
 Almost any form - - - - -

\*1) Par. 166. — \*2) Passive resolution; a little troublesome in minor. — \*3) Possible, but weak. — \*4) Likely to be one bass tone, as in Ex. 171, meas. 2.

GENERAL PRINCIPLES.

242. The following general principles and directions should always be borne in mind, in determining the harmonic basis of a melody:

(1) **Always look forward.** Never define the chord of any melody-note without considering its relations to, and possible influence upon, the *following* tone or tones.

(2) The attention should be directed chiefly to the **accented** beats. The unaccented notes are of less importance, and must accommodate themselves to the chords which the accented beats require.

(3) Mark, at the outset, all those scale-steps which can be relied upon with reasonable certainty, throughout the phrase. Namely: the very first chord (I); the semi-cadence (generally V, or  $\overset{7}{I_2}-\overset{7}{V}$ ) and the perfect cadence ( $\overset{7}{V}-\overset{7}{I}$ , or  $\overset{7}{V}-\overset{7}{I}$ , or  $\overset{7}{I_2}-\overset{7}{V}-\overset{7}{I}$ ); the 3rd step (I); the 7th step (V, etc.); and the 6th step (IV, or  $\overset{9}{V}_0$ ).

(4) *After doing this*, sing (or play) the melody through once or twice in correct time and rhythm, and endeavor to discern its harmonic basis by instinct (by "ear"), applying slurs where successive tones (of the same beat or accent) evidently or *probably* belong to the same chord.

243. The following table, in which the *most natural and probable* harmonic basis of each scale-step is again shown, as summary of the foregoing rules, should be thoroughly memorized:

Ex. 178.

1st step 2nd 3rd 4th 5th 6th 7th

$I_1$  V II I  $IV_1$   $\overset{7}{V}$  etc. I IV  $\overset{9}{V}$  etc.  $\left( \begin{matrix} II & \overset{7}{V} \\ IV & \overset{7}{V}_1 \\ IV_1 & \overset{7}{V} \end{matrix} \right)$  V  $\overset{7}{V}$   $\left( \begin{matrix} III \\ (III_1) \\ V - \overset{9}{V} \end{matrix} \right)$

$\left( \begin{matrix} I \\ IV \\ IV_1 \end{matrix} \right)$   $\left( \begin{matrix} II \\ (V_1) \end{matrix} \right)$  ?? (VI) (IV)  $\overset{9}{O}$   $\overset{9}{V}$  min.  $\left( \begin{matrix} I_1 \\ V_1 \\ (V) \end{matrix} \right)$  (II)  $\overset{9}{V}$  etc.  $\left( \begin{matrix} II & \overset{7}{V} \\ IV & \overset{7}{V}_1 \\ IV_1 & \overset{7}{V} \end{matrix} \right)$   $\overset{9}{O}$   $\overset{9}{V}_1$   $\overset{9}{O}$   $\overset{9}{V}$  min.

EXERCISE THIRTY-SIX.

a.

b.

\*1) \*2) \*3) \*4) \*5)

VI

\*1) Ex. 144. — \*2) Par. 168. — \*3) Par. 193. — \*4) Change the chord at this bar. — \*5) Exercise 32, Note \*11). — \*6) Passive resolution. — \*7) When the leading-tone (in the melody) *leaps*, as here, it is evident that the dominant chord must be repeated.

N.B. — The student may extend this exercise by *reharmonizing all of the melodies given up to this point*, with the material of this lesson. This he is warmly urged to do, as nothing is more important than facility in harmonizing melodies, and nothing makes perfect but *practice*.

SECTION 2. THE DISCORDS OF THE SECOND CLASS.

244. The fundamental tone of this class is the second perfect 5th above the tonic, or, the **second step** of the scale. Review par. 198. Therefore, the 2nd class embraces the chord of the 7th on the second step, the chord of the 6th on the second step, and the chord of the 7th on the fourth step, as incomplete chord of the 6th, — in major and minor.

\*1) Spoken: "Two-seven," "Two-seven-one," etc., and figured as usual, 7,  $\frac{6}{6}$ ,  $\frac{4}{3}$ , 2. — \*2) The II is available in 4-part harmony only without its root, as IV (see par. 233a, b). — \*3) Called "Four-seven" instead of "Two-nine, incomplete," on account of its relation to the triad IV.

245. To this class belong also, as concords, the fundamental 3-tone chord II, and its parallel, the IV, which is actually an incomplete two-seven, — in analogy with par. 221.

Compare par. 110a; and see par. 259.

A. THE  $\overset{7}{\text{II}}$  AND ITS INVERSIONS.

246. *a.* These chords are not quite as common as those of the First class, but they are barely less important, especially in modern harmony. They are treated, *relatively speaking*, almost exactly like the dominant chords, only a little more strictly. The principal external distinction is, that the  $\overset{7}{\text{II}}$  has a **minor third**, while that of the  $\overset{7}{\text{V}}$  is *major*. Moreover, the Second-class chords do not contain the leading-tone (as those of the First class do), but the 4th and 6th steps of the scale (see par. 112).

*b.* The chord-seventh is resolved *diatonically downward*, or *remains stationary* (passive res.), and is not doubled. In the  $\overset{7}{\text{II}}$  itself, as *fundamental* chord, the fifth may be left out; but in the inversions no omissions are possible.

*c.* The **normal** resolution is effected, as usual, by the chords which lie a perfect 5th below, namely, those of the **First class** (dominant).

This fundamental rule operates in its most comprehensive sense. Every 2nd-class chord is normally resolved into *any* and *every* 1st-class chord, concord or discord. The same is true of all the discord classes, each of which obtains its normal res. by progressing into the *preceding* class; the 2nd into the 1st, the 3rd into the 2nd, and the 4th into the 3rd. See par. 259.

*d.* The **passive** resolution, for which this discord-class evinces a decided preference, is effected by the tonic chords (I or VI), which contain its dissonance as consonant interval:

(Comp. par. 216.)

$\overset{7}{\text{II}}$     I     $\overset{7}{\text{II}}$     VI

*e.* The seventh should be introduced strictly, as a rule; rarely with a skip, or diatonically from below.

Ex. 180. \*1)

$\overset{7}{\text{II}}$      $\overset{7}{\text{II}}_1$

$\overset{7}{\text{II}}_2$

\*1) Major and minor. Separate measures, as usual. — \*2) Normal res. — \*3) This is the first case of different *discords in succession*. The resolution into the dominant 7th or 9th is better for the key, than into the triad. — \*4) Passive res. — \*5) After the pass. res. it is best to return to the same chord-class, as here. Compare par. 217a. — \*6) Ex. 153, Note \*1). — \*7) In the pass. res. no other part should run into the seventh. Here the soprano is wrong; the preceding measure is right. Comp. Ex. 157, Note \*4). — \*8) The 2nd inversion is the weakest form, naturally; it is better (stronger) in minor. — \*9) When the bass progresses upward into the leading-tone, the seventh (being the *keynote itself*) may skip downward to the dominant, or move parallel with the bass in 3rds, as in the next measure. (See par. 218a.) — \*10) The pass. res. of the seventh in *bass* is very doubtful. — \*11) These last two measures are exceptional. — \*12) In the  $\overset{7}{II}$  *itself* the fifth may be omitted.

B. THE  $\overset{7}{IV}$  AND ITS INVERSIONS.

247. a. The assignment of this chord to the Second discord-class, instead of assuming that it forms an independent class on account of the principal tone upon which it stands (the subdominant), is justified by all of its harmonic movements, by its sound, and by analogy with the development and arrangement of the First discord-class.

b. The dissonances (7th and 9th, — *5th and 7th in this form*) are treated like those of the dominant. The introduction is *perfectly strict*.

c. No interval can be omitted, and none doubled (par. 236d).

d. The chord is the same in character in major and minor. The ninth may lie in *any* part.

Ex. 181.

\*1) These parallel 5ths are even more likely to occur than in the analogous resolution of the  $\overset{\circ}{V}$ , — Ex. 172, Note \*1); they are best avoided by progressing into the *discords*  $\overset{7}{V}$  or  $\overset{\circ}{V}$ . — \*2) Passive res. — \*3) Ex. 171, Note \*1). — \*4) Partial res. See Ex. 167, meas. 4, 5. — \*5) The treatment of a 7th is less strict, when accompanied by the ninth. See Ex. 180, Note \*9). — \*6) The 2nd and 3rd inversions (seventh and ninth in bass) have no passive resolution. Comp. Ex. 180, Note \*10).

THE DIGRESSION INTO THE NEXT HIGHER CLASS.

248. The passive resolution of the First-class discords (par. 215, 216a, which review), may also be made into the *discords*  $\overset{7}{II}$  and  $\overset{7}{IV}$ , as well as into the *concord*s  $\overset{7}{II}$  and  $\overset{7}{IV}$ . In this case the progression again represents the *reverse of the normal resolution*, being the *upward* instead of the *downward* direction: in the most literal sense, a “Digression” from the natural order of harmonic succession. Thus:

249. When First-class chords ascend in this manner into Second-class discords, the rules of the passive resolution must be strictly respected, namely:

- a. The first dissonance (dom.-7th or 9th) *remains in the same part*;
- b. The progressions of the parts must be smooth; and
- c. After the digression, *the first chord must return*, in the same or in a different form. See par. 217a; 217b is not valid in this case.

Ex. 182. <sup>\*2)</sup> <sup>\*3)</sup> <sup>\*5)</sup> <sup>\*4)</sup> <sup>\*5)</sup>

The musical notation shows a sequence of chords in a single staff. Below the staff, the following figured bass notation is provided:  $\overset{7}{V}$   $\overset{7}{II}$   $\overset{7}{V}$   $\overset{7}{V}$   $\overset{7}{II}??$   $\overset{7}{I}$   $\overset{\circ}{V}$   $\overset{7}{II}$   $\overset{7}{V}$   $\overset{\circ}{V}$   $\overset{7}{II}$   $\overset{7}{V}$   $\overset{7}{IV}$   $\overset{7}{V}$   $\overset{\circ}{V}$   $\overset{7}{IV}$   $\overset{7}{V}$   $\overset{7}{IV}$   $\overset{7}{V}$   $\overset{7}{IV}$   $\overset{7}{V}$ .

\*1) Major and minor. — \*2) The second dissonance, in this connection, usually enters from *below*. — \*3) See 249c. Two pass. resolutions in succession are not plausible. — \*4) This is unusual, but good. It corresponds to Ex. 187. — \*5) Major only. — In general, par. 66 must be complied with.

Further illustrations of 2nd-class chords:

Ex. 183. Ex. 184. MENDELSSOHN

The musical notation shows two examples of chord progressions. Below the notation, the following figured bass notation is provided:  $\overset{7}{V}_2$   $\overset{7}{I}$   $\overset{7}{I}_1$   $\overset{7}{IV}_1$   $\overset{7}{VI}_3$   $\overset{7}{IV}$   $\overset{7}{II}$   $\overset{7}{IV}$   $\overset{7}{II}_1$   $\overset{7}{II}_1$   $\overset{7}{V}$   $\overset{7}{I}$ .

MENDELSSOHN

FUNDAMENTAL PRINCIPLES.

The 2nd chord-class or second-dominant element embraces the discords  $\overset{7}{II}$ ,  $\overset{9}{(II)}$ ,  $\overset{7}{IV}$ , and the con-  
cords II and IV.

The normal resolution of each discord-class is effected by the preceding class (a perfect 5th below).  
The "digression" or passive resolution is effected by the following class (a perfect 5th above).  
After the "digression," the first discord reappears.

EXERCISE THIRTY-SEVEN.

A. Basses. The given positions (upper figures) may be ignored, if desirable.

CHERUBINI

\*1) Par. 106a. — \*2) Exercise 21, Note \*6). — \*3) Par. 236b. — \*4) Rhythm  $\text{♪ ♪ ♪}$  — \*5) See par. 116b. Here it is chord-repetition, and a sequence. — \*6) Par. 229a. — \*7) An exceptional *complete* Two-nine. — \*8) Par. 249.

B. Play the following chord-progressions at the piano, in different major and minor keys. At first with the right hand alone, and then with both hands, the bass alone in the left.

$$\begin{aligned}
 & I_1-II_1-V_2-I \parallel VI-II_1-V-I \parallel IV_1-II_1-V_3-I_1 \parallel I-II_3-V_1-I \parallel I-II_3-V-I \parallel \\
 & II-I_1-II_1-I_2-V-VI \parallel I_2-IV-V_2-I_1 \parallel I_2-IV_1-V-I \parallel IV-IV_3-V_2-I \parallel \\
 & VI-IV-I_2-V-I \parallel V_1-II_3-V_1-VI \parallel V-IV_2-V_1-I \parallel
 \end{aligned}$$

C. A number of Original phrases.

D. Melodies. The II or IV, in any convenient form, at each \*.

SECTION 3. THE 3RD AND 4TH DISCORD-CLASSES.

250. The discords of the 3rd and 4th classes are very rare. (See par. 198e.) They are hardly ever used as *essential* members of the fundamental chord-succession, but as passing chords, usually upon *fractions of beats*, or on short beats, between the more essential chords. Nevertheless, their actual existence as genuine harmonic bodies, their origin, and their comparative significance in their key are unmistakably apparent in Ex. 147, and therefore they claim a certain degree of consideration. Their possible existence *slightly* modifies par. 70.

A. THE DISCORDS OF THE THIRD CLASS.

251. a. The 3rd discord-class embraces the chord of the 7th on the **sixth step** (the third perfect 5th above the tonic) in major and minor; the chord of the 9th on the **sixth step**, and the chord of the 7th upon the **first step** (as incomplete ninth) *in major only*.

Ex. 184. Major:  $\overset{7}{VI}^{*1}$ ,  $\overset{7}{VI}_1$ ,  $\overset{7}{VI}_2$ ,  $\overset{7}{VI}_3$ . Minor:  $\overset{7}{VI}$ . Major only \*3:  $\overset{9}{VI}$  or  $\overset{7}{I}$ ,  $\overset{7}{I}_1$ ,  $\overset{7}{I}_2$ ,  $\overset{7}{I}_3$ . \*2)

\*1) Spoken: "Six-seven," and figured as usual. — \*2) Spoken: "One-seven." — \*3) These chords cannot appear in minor, because the ninth (*b*) could not be resolved diatonically downward (Ex. 70).

b. This chord-class, unlike the First and Second classes, consists exclusively of *discords*. The *concord*s VI and I, which occupy the same scale-steps as the 3rd class, are the representatives of the *tonic class*.

The most important and essential quality of the tonic element is its inactivity, as basis or "centre" of its key; and when this quality is nullified by the addition of a dissonant interval, *it ceases to be a "tonic" harmony*, in the correct sense of the term, and assumes a place among the discords. Review par. 198c.

Hence, the *triads* I and VI are tonic chords because they are consonant; but as chords of the seventh ( $\overset{7}{VI}$  and  $\overset{7}{I}$ ) they become Third-class harmonies, and are subject to the laws of that class.

252. The rules for the treatment of these chords are as follows:

a. Seventh and ninth are resolved as usual, diatonically *downward*, and are introduced *strictly*.

b. The normal resolution is effected by the preceding class (the Second), namely, by the II, IV,  $\overset{7}{II}$ ,  $\overset{7}{IV}$ . Comp. par. 246c.

Ex. 185. \*1)  $\overset{7}{VI}$   $\overset{7}{VI}_1$ . \*2) 87  $\overset{7}{II}$   $\overset{7}{II}$   $\overset{7}{II}$   $\overset{7}{IV}_1$   $\overset{7}{II}$   $\overset{7}{II}$   $\overset{7}{II}$   $\overset{7}{II}$

\*1) Major and minor. — \*2) The fifth of the VI *itself* may be omitted, and the third doubled. Comp. Ex. 180, Note \*12). — \*3) The 3rd inversion (chord of the second) is one of the most useful forms, here as elsewhere.

Ex. 186.  
\*1)

\*1) Major only. — \*2) When the leading-tone becomes a chord-seventh, it must obey the law of 7ths, and move *downward*. — \*3) This measure is not strictly harmonic; I-VI is not a genuine "resolution." It is chord-repetition, practically, and the *b* in bass is a passing-note only.

#### IRREGULAR PASSIVE RESOLUTION.

**253.** These chords may also progress into *dominant discords*, in which case the succession corresponds to the passive resolution, because, as in former cases (V-IV, II-I), the dissonance of the first chord becomes, by remaining, a consonant interval of the following chord. But in this case the passive resolution is made irregularly: the dissonances of the 3rd class are too weak to be held, and therefore they resolve immediately, diatonically downward, into the dissonances of the dominant chords. This is a very effective and important progression, and almost preferable to the regular normal resolution, as a stronger chord-class (the dominant) is quickly reached.

Ex. 187.

par. 66

\*1) See par. 66. — \*2) With the exception of this measure, the whole example is possible only in major, because the 6th step usually ascends. — \*3) When the I is so brief, it is only a passing chord. Comp. Ex. 186, Note \*3)

254. The “digression” from the 2nd class into the 3rd (comp. par. 248) is made as follows:

Ex. 188.

\*1) The progression of the  $\overset{7}{VI}$  into the  $\overset{7}{oV}$  after the digression, although contrary to par. 249c, is allowed, because the seventh *g* is *actually resolved* into *f*. — \*2) Weak.

EXERCISE THIRTY-EIGHT.

(The positions may be ignored.)

\*1) Omit the fifth. — \*2) Rhythm ♩ ♩ — \*3) See par. 218*a*. — \*4) Ex. 186, Note \*2).  
Add Original basses.

### B. THE DISCORDS OF THE FOURTH CLASS.

**255.** This exceedingly rare class of discords consists of the chords of the 7th and 9th upon the **third** step in major and minor, and the triad III in minor.

The chord of the ninth is, as usual, almost useless in 4-part harmony, and when its root is removed, the original  $\overset{7}{V}$  reappears. This proves that the circle of chords which constitutes a key is herewith completed.

\*1) Spoken: "Three-seven." — \*2) The III in minor is an **augmented triad** (par. 127). It is more peculiar in sound than the diminished triads, but very effective when properly used.

### THE $\overset{7}{III}$ IN MAJOR.

**256.** The  $\overset{7}{III}$  in major is resolved normally into 3rd-class chords (comp. par. 246*c*),  $\overset{7}{VI}$  (and  $\overset{7}{VI}$ ); not into the  $\overset{7}{I}$  or  $\overset{7}{I}$ . But, similar to the 2nd and 3rd classes, it prefers an irregular res., into the IV and IV. See par. 124*b*. The dissonance is treated like other sevenths.

Ex. 190.

\*1) When followed by the I, the III is not an *actual chord*, but only a combination of grace-notes resembling a chord. Comp. Ex. 186, Note \*3). — \*2) The “digression” from 3rd-class into 4th-class chords is possible in major, but very inferior, and rare.

THE III, III<sup>7</sup> AND III<sup>9</sup> IN MINOR.

257. a. The triad III in *minor* sounds, and is treated, very differently from the major III. Its dissonance (the augm. fifth), being the leading-tone of the *minor* scale, *must ascend to the tonic*. (See also par. 201.) The best resolution is the normal, into the VI (or VI<sup>7</sup>). The irregular resolution is hazardous, on account of the upward progression of the leading-tone; only the IV<sub>1</sub> is possible. The dissonance may lie in any part, and is introduced *strictly*.

Ex. 191.

\*1) The line through the figure 5 signifies, as usual, that the corresponding note is *raised*. — \*2) When an accidental stands alone, in the bass figuring, it refers to the figure 3. — \*3) The progression of the III or III<sub>1</sub> into the I or V is not “harmonic”; Ex. 190, Note \*1).

258. a. The chord of the III in minor is effective when properly treated.

b. The III is not absolutely useless, — probably on account of its resemblance to the V<sup>7</sup>. It is treated like the III itself; the seventh and ninth resolve *downward*.

Ex. 192.

TABLE OF THE HARMONIC SYSTEM OF A KEY.

259. The following table illustrates the arrangement and relations of the chords within each key.

	Tonic class	Dominant or First class	Second-dominant (Subdominant), or Second class		
Concords	I VI and inversions	V (III) and inversions	IV II and inversions		
		$\overset{7}{V}$ $\overset{\circ}{\overset{7}{V}}$ $\overset{\circ}{\overset{7}{V}}$ $\overset{\circ}{\overset{7}{V}}$ and inversions	$\overset{7}{II}$ $\overset{\circ}{(II)}$ $\overset{7}{IV}$ and inversions	( Third class	Fourth class )
Discords				$\overset{7}{VI}$ $\overset{\circ}{(VI)}$ $\overset{7}{I}$	$\overset{7}{III}$ $\overset{\circ}{(III)}$ III in minor

a. The chords in parenthesis are rare.

b. The classes are a *perfect fifth* (harmonic degree) apart; par. 198a.

c. The tonic class is inactive, the others are all active; comp. par. 251b.

d. The normal (regular) progressions or resolutions are made by each class *one grade from right to left* (towards the tonic); par. 100b; 246c.

e. The reversed progression (away from the tonic) is the "digression"; par. 248; also 100a. This, and the progression of two grades (par. 253), are both irregular.

f. Every regular progression is complete in itself, and cancels the obligations of its class. Every irregular progression, on the contrary, is only a partial resolution, or none at all, and demands justification by subsequent resolution. The best and commonest method is, after every irreg. prog., to return immediately to the former class; Ex. 67, Note \*2); par. 217a.

g. The movements of the triad III are eccentric.

SEQUENCES.

260. A sequence is the reproduction of a tone-figure upon other, higher or lower, steps. When limited to one part it is called a melodic sequence; when applied to all four parts at once, it is a full harmonic sequence.

261. Such shifted reproductions are possible almost anywhere, because every chord of every class is subject to the selfsame rules, as has been seen. And where irregularities or exceptional movements result, they are considered justified by the sequential (i.e., uniform) arrangement of the tones.

262. The following formulæ, deduced from foregoing illustrations, will be found useful for the formation of tone-groups which may be utilized in the sequence:

a. The succession 8-7 represents the introduction of a 7th diatonically from above. This, followed by the descending resolution of the 7th, is always good. The interval 8 may represent a doubled root, in any two of the parts; and either of the two tones may descend to the chord-7th, the other tones being held:

Ex. 193.

\*1) Here the body assumes the form of a 4-3 chord; and \*2) here that of a chord of the second. The principle is everywhere the same; the *root* is doubled. — \*3) These measures form a continuous phrase, to the heavy bar.

Or the interval 8 may represent a *doubled third*, in any two parts, with similar treatment:

Ex. 194.

\*1) Note the variety of results from doubling this third (*e*) in different parts, and allowing *either* of the two tones to glide downward. — \*2) Note that when the *chord-third* is thus doubled, *two* parts always glide down together *in parallel thirds, or sixths*. Par. 66.

b. The interval 8 may, rarely, represent the chord-fifth, and in this case one part usually glides *upward*, — the stationary tone becoming a 7th by preparation:

Ex. 195.

\*1) The 7th, in this case, generally remains (passive resolution). The somewhat complex bass-figuring differs according to the interval which chances to be in bass.

263. The most of these groups are limited to *major*, as the scale-steps 6-7 are almost constantly implicated in such general movements. But the chords may appear *in any time-values*, — full beats as well as fractions.

264.A. With this material, and a few other combinations, harmonic sequences may readily be formed. For example:

Ex. 196.

\*1) The sequential recurrence can begin only where the formation corresponds to the beginning of the original group. —  
 \*2) These irregularities are all excused by the sequential agreement. — \*3) The sequence may appear in any altered rhythmic form, or at any beat.

EXERCISE FORTY.

Original phrases, illustrating the formations in Exs. 193 to 196, but with correct perfect cadence.

HARMONIZING OF UNFIGURED BASSES.

264, B. The harmonizing of an unfigured bass does not differ materially from that of a given soprano. The most important aim is to obtain a melodious soprano. The following table indicates the treatment of each scale-step in bass:

	$\begin{matrix} 7 \\ \vee \\ \vee \\ 7 \\ \vee_0 \\ \vee_0 \\ \vee_0 \\ \text{II} \end{matrix}$	$\begin{matrix} \text{(V)} \\ 7 \\ \vee_0 \\ \vee_0 \\ \text{II} \\ \text{(II??)} \end{matrix}$	$\begin{matrix} \text{I} \\ \text{(IV)} \\ 7 \\ \text{II} \end{matrix}$	$\begin{matrix} \text{I} \\ \text{II} \\ 7 \\ \vee_0 \\ \text{III??} \end{matrix}$	$\begin{matrix} \text{IV} \\ \text{II} \\ 7 \\ \vee_0 \\ \text{V??} \end{matrix}$	ditto	$\begin{matrix} 7 \\ \vee \\ \text{IV} \\ \vee_0 \\ \text{(II)} \end{matrix}$	$\begin{matrix} \text{IV} \\ \text{II} \\ 7 \\ \vee_0 \\ \vee \end{matrix}$	$\begin{matrix} \text{V} \\ 7 \\ \vee \\ \vee_0 \\ \text{I}_2 \end{matrix}$	$\begin{matrix} \text{IV} \\ \text{II} \\ \text{(II)} \\ \vee_0 \\ \text{(V_0??)} \end{matrix}$	$\begin{matrix} \vee \\ 7 \\ \vee \\ \vee_0 \\ \text{(V_0??)} \end{matrix}$
--	---	---	---	--	---	-------	---	---	---	---	---

Ex. 196B. C major

Step 1 2 minor 3 4 — 5 4 — 4 4 — 3 4 — 2 5 6 min. 7

\*1) See also par. 211, and par. 226. And compare the whole table with Ex. 178.

EXERCISE FORTY-ONE.

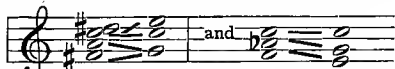

Each of these unfigured basses should be worked out in at least three different ways (with new soprano).

The image contains four musical staves, each in bass clef.   
 Staff a: C major, 2/4 time. It starts with a whole note chord (C2), followed by a sequence of notes leading to a deceptive cadence marked \*4).   
 Staff b: C major, 3/8 time. It features a sequence of eighth notes leading to a semi-cadence marked \*1).   
 Staff c: C major, 3/8 time. It features a sequence of eighth notes leading to a deceptive cadence marked \*4).   
 Staff d: C major, 2/4 time. It features a sequence of notes leading to a plagal cadence marked 'Plagal cad.' and a semi-cadence marked \*1).

\*1) Semi-cadence, with  $I_2$ . — \*2) Comp. Ex. 146, Note \*2). — \*3) Upper parts held. — \*4) Deceptive cadence.

### DIVISION C. THE ALTERED AND MIXED CHORDS.

**265.** Altered and mixed chords contain one or more tones written with accidentals ( $\sharp$ ,  $\flat$  or  $\natural$ ) and therefore foreign to the scale in which they appear, but which nevertheless, from their connections and their effect, obviously belong to the *principal key*, and not to that key which the chromatic (foreign) tone seems to indicate.

For example, the chords  and many others, are used in C major as if they were legitimate chords of that key (despite the  $d\sharp$ ,  $f\sharp$  and  $ab$ ), without disturbing the identity of C major by conveying a distinct impression of the keys to which these foreign tones *actually* belong.

**266. a.** Such chords are called “altered” or “mixed,” and the foreign tone, which is “borrowed” from a related scale, is defined as a chromatically **raised or lowered scale-step** of the original key.

*b.* That a key and chord may embrace a chromatic tone, foreign to its scale, is a fact which, contradictory as it may appear, is confirmed on every page of classic music. The operation of this principle has already been seen, in the formation of the minor mode. See par. 101.

*c.* The object of such foreign tones is: To enlarge and enrich the scale; to confirm, or to modify, the melodic tendencies of the scale-steps; and to affiliate the keys by increasing the number of common tones (for instance, by raising the 4th step of C to  $f\sharp$ , the scales of C and G major are affiliated).

**267.** It is evident that such foreign tones can be introduced into a scale only upon certain conditions. They are as follows:

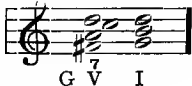

*a.* The altered tone must be reasonably *brief*; otherwise it may, by sheer length, assert its independent individuality and produce the impression of the scale to which it actually belongs. The limit will generally be one or two beats.

*b.* It must occur in such a connection as not to interfere with the legitimate harmonic action of the key. Hence, *only certain steps of the scale* can be altered, and these *only in certain chords*.

c. The most important condition is, that the *following chord shall unmistakably indicate and confirm the original key*. That is, the altered chord will (as a rule) be immediately followed by a *tonic chord* (I-I<sub>1</sub>-I<sub>2</sub>), or, more rarely, by a  $\overset{7}{V}$  or  $\overset{6}{V}$ .

d. When the chord which *follows* (and, as is probable, the chord which *precedes*, also) confirms the original key, then *no change of key takes place*, and the foreign tone is merely a transient chromatic inflection of the corresponding scale-tone.

In this case:  the accidental is not an actual f#, in its legitimate personality as leading-tone of

G major, but merely "f-raised" or "f-altered." But if, on the contrary, the next chord corroborates the foreign tone, as tonic chord of the key which that tone seems to represent, thus:  then it proves to be an *actual* f# in its genuine capacity as leading-tone of G major.

e. In a word, as a general fundamental rule *one chord alone does not represent and indicate a whole key*, any more than one isolated tone can represent a chord or scale. If a foreign chord stands isolated between two chords which are unmistakably indicative of the original key, then *it also belongs to that key*, — of course, as altered chord; but, if the following chord confirms the key suggested by the foreign tone, then these two chords *together* constitute a more or less complete modulation, or change of key.

*The identity of a chord depends upon what it does, — i.e., upon its progression.*

f. Altered chords are always defined according to the *scale-step* which is raised or lowered.

SECTION I. THE ALTERED CHORDS.

A. IN MAJOR.

268. The altered chords have a legitimate chord-form, and therefore coincide with authentic chords of some other key.

269. The introduction and progression of altered chords are subject to the following rules:

a. Lowered notes descend. Raised notes ascend. Comp. par. 201.

b. Altered notes must not be doubled.

c. *In general*, the altered chords are treated the same as if unaltered. The principal exception is par. 267c: *i.e.*, they generally resolve into the I (or Five-seven).

d. The altered note may be introduced *diatonically* (for instance, the tone a<sub>b</sub> from g), or *chromatically* (the tone a<sub>b</sub> from a). See Note to Ex. 8.

e. In chromatic successions, the *first* tone should not be doubled, unless the other tone (the duplication) progresses *diatonically*, *contrary to the direction of the chromatic progression*. See Ex. 198, Note \*6). And the chromatic progression must be made in *one single part*. Ex. 198, Note \*7).

270. The 6th step may be lowered, in the following chords:

Ex. 197. C major

Altered chords \*2) Resolution

$\overset{9}{V} \overset{b}{1}$   $\overset{6}{V} \overset{b}{0}$  II  $\overset{7}{II} \overset{b}{9}$  IV  $\overset{7}{IV} \overset{b}{9}$  VI  $\overset{7}{VI} \overset{b}{9}$  I I<sub>1</sub> I<sub>2</sub>  $\overset{7}{V}$

With all inversions

\*1) Spoken: "Five-nine altered." The flat indicates that the chord contains a *lowered* scale-step. — \*2) These three chords are possible, but rare.

The intr. and prog. of the chords with lowered 6th step, are effected as follows:

Ex. 198. C major

C major C minor \*3)

\*1) \*2)

$\flat$  V  $\flat$  V<sub>0</sub> II IV \*4)

\*5) good or

IV  $\flat$  V<sub>0</sub> IV \*6) \*7)

\*1) With  $e\sharp$ , as I of C major, the preceding chord is altered, in C major. — \*2) With  $e\flat$ , as I of C minor, the preceding  $a\flat$  is a legitimate scale-step, and the chord is authentic, in C minor. See par. 267d. — \*3) This is the chord of the diminished 7th, which, in this altered form, becomes as available in major as in minor. — \*4) The altered scale-step may lie in any part. — \*5) Comp. par. 267a. — \*6) This is wrong, because the  $a$  in tenor which is about to move chromatically into  $a\flat$ , is doubled in bass, where it progresses with a skip. In the next measure, where the duplicating tone moves diatonically, the so-called "cross-relation" is rectified. See par. 322. — \*7) The chromatic inflection cannot be divided between two parts, as here in bass and soprano.

271. a. The raised 2nd step, when alone, can occur only in chords of the First class; i.e., in dominant chords.

b. The raised 4th step can never occur in any other than Second-class chords; i.e., in the II, IV,  $\overset{7}{II}$ ,  $\overset{7}{IV}$ .

c. The 2nd and 4th steps may be raised together; but (on account of the 4th step) only in a Second-class chord.

Ex. 199. C major

a. Raised 2nd step b. Raised 4th step

$\sharp$  V\*1) I  $\sharp$  V<sub>1</sub> I  $\sharp$  V<sub>2</sub> I<sub>1</sub>  $\sharp$  II<sub>1</sub> I<sub>2</sub>  $\sharp$  IV<sub>1</sub> I<sub>2</sub>  $\sharp$  II<sub>1</sub> I<sub>2</sub>  $\sharp$  II<sub>2</sub> I<sub>2</sub>

Best in these inversions - - - - -

(?) ? c. Raised 2nd and 4th steps

$\sharp$  V \*3)  $\sharp$  V \*4)  $\sharp$  IV I<sub>2</sub>  $\sharp$  IV<sub>1</sub> I<sub>2</sub>  $\sharp$  II \*5) I<sub>1</sub>  $\sharp$  II<sub>1</sub> I<sub>2</sub>  $\sharp$  II<sub>2</sub> I<sub>2</sub>  $\sharp$  II<sub>3</sub> I \*6)

Intr. and Res.

\*1) Spoken "Five-altered;" the # indicates that the chord contains a *raised* scale-step. — \*2) It will be noticed that most of the altered chords of the 2nd class progress into the  $I_2$  (6-4 chord). — \*3) The progression into the  $\overset{7}{V}$  reestablishes the original key, and is therefore admissible; but it is rare, and does not sound genuine. The chromatic succession, in this instance, will be divided between two parts, if the raised step ascends. See Ex. 206, Note \*1). — \*4) In this case the  $f\#$  can hardly be termed a raised 4th step of C. This progression will be explained later. — \*5) The two sharps above the II indicate that the chord is "double-altered." — \*6) This inversion of the altered II is somewhat rare. The passive res. of the seventh in the lowest part is uncommon. See Ex. 180, Note \*10).

272. The following alterations in major are *much less common*:

- a. The 5th step may be raised; but only in the I or I.
- b. The 1st step may be raised, in the I or VI (VI).
- c. The 6th step may be raised, but only in connection with the raised 1st step, — never alone.
- d. The raised 1st step, or 1st and 6th steps, must be followed by a Dominant-discord, — not by the V itself.
- e. The 6th and 2nd steps may be lowered together, — only in the II<sub>1</sub> (II<sub>2</sub>).
- f. The 7th step may be lowered (as in minor, — par. 277), — only when followed by the lowered 6th step; it is very rare, but possible in the V,  $\overset{7}{V}$ , III,  $\overset{7}{I}$ , — see Exs. 205 and 206, which may be written, almost throughout, with  $e\flat$  instead of  $e\flat$ .

Ex. 200.

a. Raised dominant      b. Raised tonic      c.d. Raised tonic and 6th step      not C. maj.

5# I\*1) IV      7# I

# I      7 V      7# 7 VI<sub>1</sub> V      7# 7 VI V      7# 7 VI<sub>1</sub> V      7# 7 VI<sub>2</sub> V      ⊕ V \*e)

\*2)      \*3) \*4)      \*5)

e. Lowered 6th and 2nd steps      f. Lowered 7th step

$\flat\flat$  II<sub>1</sub>      I<sub>2</sub>      \*7) V      7 $\flat$  I       $\flat$  IV

Intr. and res. good

$\overset{\#}{I}$   $\overset{7}{V}$        $\overset{7\#}{VI}$        $\overset{7\#\#}{VI}$        $\overset{7}{V}$        $\overset{bb}{II_1 I_2}$        $\overset{V}{V}$

\*1) Thus marked to indicate that the *fifth* is raised. — \*2) The resolution of the altered tone (upward into *a*) renders the IV necessary, as resolution. This is not directly contradictory of par. 267c, because the IV does not confirm the *g*<sup>#</sup> as leading-tone of A minor. — \*3) This notation denotes that the root of the I is raised. — \*4) Par. 272d. See Note \*6). — \*5) When the  $\overset{7}{VI}$  is altered, its seventh will remain stationary, — contrary to Ex. 187. — \*6) If the V itself were to follow, these chords would both be in *G major*. The  $\overset{7}{V}$ , on the contrary, reestablishes the original key (C). — \*7) The peculiar progression in soprano is necessary here.

In the following additional illustrations of the altered chords in major, the numbers after Mendelssohn's name refer to his "Songs without Words:"

\*1) Par. 272e. The *ab* in bass is an organ-point (par. 365a). See also Ex. 282, No. 6.

B. ALTERED CHORDS IN MINOR.

273. The alterations in minor are reckoned from the *harmonic* form of the scale, and they tend chiefly to remove the unmelodious progressions between the 6th and 7th scale-steps (Ex. 70). This interval embraces one and a half step, and therefore does not conform to the principle of scale-formation (par. 16). In order to reduce it to a whole step, the 6th step is raised when it ascends to step 7 and the 7th step is lowered when it descends to step 6. These alterations make the scale singable throughout (see Note to Ex. 70), and produce the so-called *melodic* forms of minor. See par. 104.

Ex. 202. C minor

Melodic forms whole step whole step

6+ 7-

N.B. Write out this example in every minor mode.

274. The altered chords in minor do not endanger the identity of their key as much as those in major do. Hence it is not so essential that the I or V should follow immediately (comp. par. 267c). The chord which follows will depend upon the tendency of the altered tone, which, of course, must be fulfilled.

275. The raised 6th step, as factor of the ascending melodic minor scale, is generally introduced diatonically from below, and progresses diatonically upward (as seen in Ex. 202). It occurs in the following chords, and is invariably resolved into dominant chords.

Ex. 203.

*a.* \*1) C minor II II<sup>7</sup> IV IV<sup>7</sup> VI VI<sup>7</sup>

*b.* Intr. and res. II V II<sup>7</sup> IV IV<sup>7</sup> V VI VI<sup>7</sup>

with inversions

\*1) Neither the  $\overset{\circ}{V}$  nor  $\overset{\circ}{V}_0$  can contain the raised 6th step, because it would interfere with the resolution of the ninth (downward). — \*2) The altered II of minor requires a free resolution of its seventh, in order to avoid a duplication of the leading-tone. It can skip down to the dominant, or pass upward in parallel 3rds with the bass. Ex. 180, Note \*9). — \*3) The raised 6th step occasionally enters with a skip *from above*.

**276.** Sometimes the 4th step is raised, in conjunction with the raised 6th step, in order to improve the *sound* of the chords.

As stated in par. 271*b*, this alteration is limited to *Second-class* chords, — II-IV-II-IV. One advantage arising from this double-alteration is, that the chords can progress into the I, as well as into the V; in which case the raised 6th step is relieved of its obligations, and *may progress in either direction*.

Ex. 204.

C minor

*a.* II<sup>7</sup> II<sup>7</sup> IV<sup>7</sup> (II<sup>7</sup>) IV<sup>7</sup>

*b.* \*1) \*2) \*3) \*4) \*5)

with inversions

IV<sup>7</sup> II<sup>7</sup> V I<sub>2</sub> V V<sup>7</sup>

\*1) Ex. 203, Note \*2). — \*2) The raised 6th step, when accompanied by the raised 4th step, may move either way. — \*3) Ex. 199, Note \*2). — \*4) See Note \*2). — \*5) See Ex. 206, Note \*1).

**277.** The lowered 7th step, as factor of the descending melodic minor scale, is introduced diatonically from *above*, and invariably progresses diat. *downward*. It occurs most naturally and frequently in the  $\overset{7}{I}$  — which it renders possible in minor; see Ex. 184, Note \*3), — and in the III or III<sup>7</sup>, which it improves in sound and treatment.

Ex. 205.

C minor

*a.*  $\overset{7b}{I}$  III III

*b.*  $\overset{7b}{I}$  IV<sup>7</sup> III IV<sup>7</sup> III<sup>7</sup> VI<sup>7</sup> II

with invars.

\*1) The lowered leading-tone resolves downward into the 6th step; consequently the resolving-chords will be the IV<sup>(7)</sup> or II. See par. 274.

278. The lowered 7th step may, of course, also occur in *dominant chords*, but it is hazardous to alter the leading-tone in the very chords which it ought to characterize. Therefore, these altered dominant chords are very rare.

Ex. 206. C minor

Best in these forms

\*1) Here again the chromatic succession is divided between two parts, contrary to the general rule (par. 269e). This exception is always permissible, if the first of the two tones (here *bb*) moves in its proper direction, and does not skip. Comp. Ex. 198, Note \*6).

279. The application of these alterations, — raising step 6 in the succession 6-7, and lowering step 7 in the succession 7-6, — makes every chord-succession hitherto limited to major, possible in minor also. For illustration:

Ex. 207. C minor

\*1) When either step 6 or 7 chances to be doubled, discrimination is necessary. The *more urgent* of the two tones must be correctly written, and simply doubled. Note the *ak*, which is urgent in tenor; also the following:

Ex. 208. C minor

The student should play *every major example* up to this point, and transform it thus into minor.

280. Further, the 2nd step may be lowered. This alteration is very common and effective, but is limited almost entirely to one single chord, — the II<sub>1</sub>. It corresponds to par. 272e.

Ex. 209.  
C minor

\*1) Possible, but very uncommon. — \*2) The lowered 2nd step may progress directly into the leading-tone, even in vocal music, notwithstanding the peculiar interval-progression. Compare Ex. 200, Note \*7).

\*1) "Songs without Words." — \*2) Here, both altered steps progress chromatically downward. This is unusual, and very irregular. Compare Ex. 199, Note \*4). — \*3) Ex. 209, Note \*1). The treatment is peculiar.

#### FUNDAMENTAL PRINCIPLES.

An altered chord must be followed by some chord which reestablishes the original key, — usually I or V ( $\bar{V}$ ).

In major, the 6th step is the only one likely to be lowered; but nearly every step may be raised. The raised 4th step occurs only in second-dom. chords.

The raised tonic must be followed by a dom.-seventh.

When the 6th step in minor rises to 7, it must be raised; and step 7 must be lowered when it falls to 6.

\*1) The accidentals in the bass-figuring refer to the figure that follows. — \*2) A line through a figure signifies, as usual, that the corresponding tone is raised. — \*3) A solitary accidental always refers to the figure 3. — \*4) The upper parts are held.

C. Add Original phrases.

SECTION 2. THE MIXED CHORDS.

A. IN MAJOR.

281. a. Mixed chords have no legitimate form, but result from “mixing” characteristic tones of different keys. Their distinctive feature is the interval of an augmented 6th, which they all contain.

For this reason they are generally called “chords of the augmented 6th.”

b. One of the most important rules for the treatment of mixed chords is, that this interval (the augm. 6th) should not be inverted. Thus, the interval  $f\sharp - d\sharp$  (in Ex. 211, 212) should not become the dim. 3rd  $d\sharp - f\sharp$ . An exception is allowed when the inverted tones lie more than an octave apart, but it is very rare. For example:

282. a. There are two kinds of mixed chords in major:

1st, those of the First class, containing a raised 2nd step, in conjunction with the seventh (or seventh and ninth) of the dominant. Compare par. 271a.

\*1) The augm. 6th arises from the association of the dom.-seventh of one key (f, of C major) with the leading-tone of another (d# of E minor). — \*2) Ex. 211, meas. 3. — \*3) The raised step often lies in the soprano, even when the major dom.-ninth accompanies it; comp. par. 229a.

b. This same augm. 6th is sometimes used (especially by Schubert) in a Second-class chord, II or II<sup>7</sup>; but it is evidently not quite genuine. Further,

c. The 2nd step is sometimes lowered, in the dom.-discords. This, also, is of doubtful quality. Finally,

d. In some extreme cases the minor ninth (lowered 6th step) is associated with the raised 2nd step in these First-class chords; but the discord is very harsh.

\*1) These chords are more likely to be mixed chords of the relative key (A minor); see Ex. 218. — \*2) The lowered 2nd step usually lies *in bass*. These two chords are probably in F major (Ex. 215).

283. The mixed chords of the First class all resolve into the tonic chord (I and inversions). Thus:

Ex. 214. C major

\*1) The raised 2nd step may enter with a skip, but only from *above*. Par. 31.

284. 2nd, the other set of major mixed chords belong to the **Second class**, and contain the **lowered 6th step**, in conjunction with the raised 4th step, or raised 4th and 2nd steps. (Comp. par. 271b.)

Ex. 215. C major

\*1) The mixed IV sounds best in this position (seventh in soprano).

The Second-class mixed chords, also, resolve into the tonic chord. Thus:

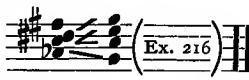

Ex. 216.

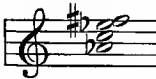

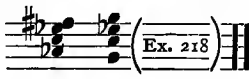

\*1) The *lowered* step generally lies in *bass*, and one of the raised steps in *soprano*; comp. Ex. 212, Note \*3). — \*2) This irregular interval-progression (*c-d#*) is allowed, into an *altered* step; especially in an inner part. — \*3) Ex. 211, meas. 3. This irregular inversion is less objectionable in this mixed chord. — \*4) The resolution into the dom.-*seventh* is possible. Comp. Ex. 199, Note \*3); and Ex. 206, Note \*1).

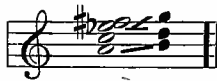

285. The raised 2nd step, in these Second-class mixed chords, is often erroneously written as if it were the *minor* *mediant*: in C major, *eb* instead of *d#*. See Mendelssohn, No. 34, measures 38 and 39:

See also No. 42, measure 3 (*db* for *c#*); and No. 48, meas. 14 (*eb* for *d#*). This common error is probably owing to an instinctive reluctance to associate *d#* with *ab*, when *eb* appears to be so much more plausible; or it may also be owing to a

thoughtless confusion of the major and minor modes. C major cannot have an *eb*, as that is the very tone which distinguishes it from C minor, as seen in Ex. 198, meas. 1, 2. The difference lies simply in the *progression* of the chord, to which, in analogy with par. 267e, the notation should conform.

Thus:  is a C major chord, and progresses to the I of C major 

But  is a C minor chord, and progresses to the I of C minor 

If in G major, then, of course, the *eb* will be right: 

Additional examples of the mixed chords in major:

Ex. 217.

1. BEETHOVEN. *Symph. 9*      2. SCHUBERT

B $\flat$  7 $\sharp$  I      E 7 $\sharp$  7 $\flat$  $\sharp$  I $_2$

3. SCHUBERT      4. BEETHOVEN. Op. 18, No. 2

G 7 $\flat$  $\sharp$  I $_2$       7 $\flat$  $\sharp$  I $_1$       G 7 $\flat$  I

5. WAGNER

Ab 9 I      9 $\flat$       9 $\flat$

\*1) "Rheingold," 1st Scene: the harmony employed where the Rhine-daughters chant their exuberant admiration of the glowing gold. — \*2) The modification of the same harmony in the final Scene of the opera, where they bewail the loss of the stolen treasure. See Ex. 318, No. 7, in which the most extreme distortion of this same harmony appears (in suggestion of intense hatred).

B. MIXED CHORDS IN MINOR.

286. There is only one group of mixed chords in minor. They contain a raised 4th step, and are consequently **Second-class** chords (par. 271b). The augm. 6th results from the association of the raised 4th step with the original dom. leading-tone.

Compare these chords with the corresponding altered chords (with raised 6th step), in Ex. 204a.

They resolve into either the I or V. Thus:

Ex. 218. C minor

#   . #   7#   7#   ??   ? \*1)

II   IV   II   IV

with inversions

7#   7#   7#   7#   7

II I<sub>2</sub>   V   IV V   IV V   V

\*1) The inversion of the augm. 6th is *least* objectionable in these mixed chords of minor. — \*2) These irregular interval-progressions are allowed. Ex. 216, Note \*2). — \*3) The resolution of this (the most frequent) form of the IV <sup>7#</sup> into the V involves inevitable parallel 5ths. Therefore it is wise to progress, as a rule, *into the I*. — \*4) Compare Ex. 206, Note \*1).

Additional examples of the mixed chords in minor:

Ex. 219. 1. MENDELSSOHN. No. 40      2.      No. 22

B min.   7# #   7# 7#   d I<sub>2</sub>   V   V   #

II<sub>2</sub> IV<sub>1</sub>   II<sub>2</sub> IV<sub>1</sub> I<sub>2</sub>   V   V   IV<sub>1</sub> — V

FUNDAMENTAL PRINCIPLES.

All mixed chords contain the interval of an augm. 6th.

This interval must not be inverted, unless the tones lie more than an octave apart.

There are two kinds of mixed chords in major: the *discords* of the *First class*, with raised 2nd step; and *Second-class* chords with lowered 6th step, combined with the raised 4th, or 4th and 2nd, steps.

# PART III.

## MODULATION.

### SECTION I. KEY-RELATIONS.

**287.** Modulation treats of the process by which a transition is made *from one key or mode into another*. This transition is effected, in general, by inflecting one or more tones of the first scale upward or downward, *whereby the location of the half-steps is changed*, and, consequently, the harmonic and melodic relations of the original scale-tones and chords are changed to conform to a new tonic basis.

**288.** All the keys in music have the same rotatory series of seven letters, *a, b, c, d, e, f, g, a, b*, etc. The difference between them is, that they start at different points in this series of letters, and therefore contain different sets of accidentals, for the adjustment of the scale-spaces. Review, thoroughly, par. 15, with reference to the origin of key-signatures.

**289.** The first requirement in the practice of modulation is a thorough knowledge of the

#### RELATIONSHIP BETWEEN THE KEYS,

that is, their relative *location* in the modulatory system. For it is this which determines the quality of the various changes of key.

**290.** The relation of key to key agrees fundamentally with the relations between the corresponding triads. But in general it is more convenient to define the degrees of relationship, first, and chiefly, according to *the number of tones which the scales possess in common*; and second, according to certain important *coincidences*, or points of contact.

**291.** The notation of the letters, and, consequently, the number of common tones, is indicated by the *signature* of each scale; therefore the degree of key-relation becomes directly apparent by simply *comparing the signatures*. (This refers to minor as well as major signatures.)

**292.** The relative location of the keys, and their signatures, are exhibited in the following chart of the modulatory system.

(Strictly speaking, the chart should present the keynotes in *vertical* order, as in Ex. 9, and at the head of Exercise 47. But for convenience they are arranged in a *circle*, because at the 12th degree the tones come so nearly together, — *f#* and *gb*, — that in musical practice they are treated as identical.)

*Explanation.* — The outer circle represents the major keys, the inner one their relative minors.

N.B. Hereafter a capital letter will indicate the major, and a small letter the minor key.

The signatures within the circles belong to both the major and the minor key. The distance from key to key, along either circle, is a *perfect fifth*, or *harmonic degree*. Comp. par. 12. This proves that *key-relations* are, fundamentally, magnified *tone-relations*. The difference in the size of the right and left half-circle is owing to the *actual* difference between *f#* and *gb*; it is here a trifle exaggerated.

293. The degree of relation between one key and another is indicated, *fundamentally*, by their distance apart in the above circles of harmonic degrees.

It will be seen that each key is surrounded by *five attendant keys*. These are called the *five next-related keys*, and they are obviously directly accessible. For instance, the five adjacent keys of C major are G, e, a, d, F; of A major, D, b, f#, E, c#. They are most quickly defined by comparison of signature, as all agree most nearly with that of the principal key. See Ex. 222, Note \*1).

The five next-related keys of any given key are also definable as those whose *tonic triads* occur in the scale of that key, — in minor, in the descending melodic scale. Thus:

Ex. 221.

From D major: D I G I F# I A I D I B I

From a minor: a I G I F I C I D I C I

\*1) Not the tonic triad of any key. — \*2) Comp. these tables with Ex. 220.

294. The next-related keys are designated as follows:

- 1st, the *dominant* key;
- 2nd, the *subdominant* key;
- 3rd, the *relative* key;
- 4th, the *relative of the dominant* (dominant-relative); and
- 5th, the *relative of the subdominant* (subdominant-relative). Thus:

		Of C:	Of a:	
	Dominant	G,	e,	*1)
Ex. 222.	Subdominant	F,	d,	
	Relative	a,	C,	
	Dominant-relative	e,	G,	
	Subdominant-relative	d.	F.	

\*1) The signatures of the 5 next-related keys do not differ from that of the principal key by more than *one accidental*. The relative key has the *same* signature as the principal key; the dominant (and dom.-rel.) have one sharp more, or one flat less; and the subdom. (and its relative) have one sharp less, or one flat more. Note the manner of indicating the major keys with capitals, and the minors with small letters.

295. Besides these five keys, there are a few others which, on account of certain important harmonic coincidences, can claim a remote degree of connection with the principal key, and can be reached more readily than other, entirely foreign, keys. They are called the *remotely-related keys*, and will be explained in due time.

GENERAL RULE OF MODULATION.

296. A modulation may be made *directly* into any one of the five next-related keys. Into the remotely-related keys a modulation may be made *directly*, under certain conditions. Foreign keys can, as a rule, be reached only *indirectly*, through the intermediate related keys.

EXERCISE FORTY-FOUR.

Make a table, in letters (large and small), of the five next-related keys of every major and minor key, with signatures, as follows. Reference to Ex. 220 should be avoided as much as possible:

Prin. key	Dom. key	Subdom.	Relative	Dom.-rel.	Subdom.-rel. <sup>a</sup>
C    ♯	G    ♯	F    ♭	a    ♯	e    ♯	d    ♭
c    3♭	g    2♭	f    4♭	E♭  3♭	B♭  2♭	A♭  4♭
G    ♯	D    2♯	C    ♯	e    ♯	b    2♯	a    ♯
g    2♭	d    ♭	c    3♭	B♭  2♭	F    ♭	E♭  3♭

and so forth.

SECTION 2. THE PROCESS OF MODULATION.

297. The transition from one key into another is effected most naturally and legitimately *through the leading-tone of the desired key*; or, in other words, through those chords which contain the leading-tone.

298. The leading-tone occurs in all the **dominant** chords (First-class concords and discords), and it is through these that the desired key should be entered. The best among them for this purpose are: the  $\overset{\circ}{V}$  (which is almost absolutely characteristic of its scale); and the **chord of the diminished seventh** ( $\overset{\circ}{V}_0$ ), which, as seen in Ex. 198 — Note \*3), — can be used equally well in major as altered chord, and in minor as legitimate chord. (Review par. 239c.)

The modulation *into* G major, for example, would be made through any of the following modulatory chords:

Ex. 223. Into G major

\*1)

Resolving into: I or VI or inv. or any inversion

\*1) The  $\overset{\circ}{V}_0$  may, of course, be used with the *major* ninth, but it is more difficult to handle.

These same modulatory chords would also be used in entering *g minor* (as well as *G major*). Because, as is obvious, the modulatory act is directed toward the *tonic*, or *keynote*, which is the same in both modes. See also par. 107.

299. This important rule is illustrated in the following modulations from C major into G major (the dom.-key):

Ex. 224.

C — G  $\overset{\circ}{V}$  — C — G  $\overset{\circ}{V}_0$  — C — G  $\overset{\circ}{V}_1$

The sign  $\times$  indicates where the entrance into the new key (the "modulation") is effected.

300. a. Modulations that are thus made with a **First-class** chord, are the most direct.

b. But it is also possible to enter the desired key through any one of its **Second-class** chords ( $\overset{\circ}{II}$ - $\overset{\circ}{IV}$ - $\overset{\circ}{II}$ - $\overset{\circ}{IV}$ ), because these resolve directly into dom.-chords. Such modulations are less abrupt.

c. Of the remaining class of chords, *i.e.*, the tonic class, only *one single form* can be used in effecting a modulation; namely, the **tonic 6-4 chord** ( $I_2$ ) of the desired key; and this should stand on an *accented* beat, or accented fraction.

It is contrary to the fundamental principle of modulation, to enter a new key with any one of its *tonic* chords; but the *accented I<sub>2</sub>* is an important exception. Review par. 186*a, b*, — from which it appears logical to regard the *accented I<sub>2</sub>* as equivalent to a dominant chord.

These more gradual transitions are illustrated in the following modulations from C major:

Ex. 225. \*4)

C — e II V — C — e II — C — d II —

C — a II — a IV a II C —  $\bar{G} I_2 V$  —

\*1) The new key is *indicated* by its 2nd-class chord; but the modulation is evidently not *complete* until the dom. chord appears. — \*2) This is the “ambiguous 7th” (par. 235). — \*3) The *I<sub>2</sub>* must be *accented* in order to exert modulatory force. — \*4) The examples hereafter will be mostly in continuous phrase-form, — not separate measures.

301. The act of modulation consists mainly in *obtaining the desired key*. But it is scarcely less important to decide at what point, — upon what chord, — the original key *may best be abandoned*.

*a.* If the last chord of the original key is one which belongs also to the prospective key (in another harmonic meaning, of course), the modulation will be gradual, and there need be no *chromatic inflection*. Consequently, such are called **Diatonic** modulations (Ex. 226*a, c*). Each chord-movement, before, during and after the change of key, pursues the track of a diatonic scale.

*b.* If, on the contrary, the last chord of the original key does *not* belong to the coming key, the modulation must be **Chromatic**.

That is, a chromatic inflection will be necessary in one or more of the parts (Ex. 226*b*), in order to gain the new scale. These modulations are more striking, and usually more effective, than the smoother diatonic species.

Ex. 226.

C to G

{ C VI — G II — V — VI — } chrom.

MENDELSSOHN. No. 22

F  $\overset{7}{V}$  — I  $\left\{ \begin{array}{l} F \text{ VI} \\ C \text{ II} \end{array} \right.$  V  $\overset{7}{V}$  — C  $\overset{7}{V}_0$  I

\*1) This chord, the last one in C major (as VI), may also be defined, prospectively, as the II of G. Consequently, the progression into the following dominant chord of G is as smooth and natural as if no change of key were taking place.  
 \*2) Here, the last chord in C (the II) does *not* belong to the coming key (G), and therefore the chromatic change of *f* into *f*# (in bass, in this case) is necessary. — \*3) Not only this last chord but also the three preceding chords belong to *both* keys. The change of key is made almost insensibly.

FUNDAMENTAL RULE OF MODULATION.

**302.** The simplest and most comprehensive rule, however, is, that *it is best to leave a key at one of its Tonic chords* (either I or VI); because these inactive harmonies, especially when accented, convey the impression of fulfillment and completion, — leave nothing unresolved or unfinished in their key, — and therefore suggest a digression into a new harmonic circle, rather than hinder it.

This rule is illustrated in Ex. 224, Ex. 225, and Ex. 226a (c?), — in all of which the last chord of the first key is either the I, I, or VI.

**303.** If the tonic chords at the close of the first key belong also to the coming key, the progression into the modulatory chord of the new key will be *diatonic* (par. 301a); otherwise the progression must be *chromatic* (par. 301b). The rules for chromatics will be found in par. 269e; Ex. 198, Notes \*6) and \*7); Ex. 206, Note \*1).

The following periods illustrate this fundamental rule, both in diatonic and chromatic operation:

MENDELSSOHN

*I. Andante*

Ex. 227.

Diatonic

Eb I  $\overset{7}{V}$  — Ab VI  $\overset{7}{V}$  — Eb I — Bb I  $\overset{7}{V}$  / Eb I  $\overset{7}{V}$  Ab V  $\overset{7}{V}$   
 Ab V-V — Eb II I $\frac{2}{2}$  — Bb IV-V — Eb V-V Ab V-V Eb I $\frac{2}{2}$  V $\overset{7}{0}$  —

Chromatic

C I  $\overset{p}{dV}_0$  I C  $\overset{p}{V}_0$  I a  $\overset{7}{V}$  VI G  $\overset{7}{V}$  I e  $\overset{7}{V}$  I a  $\overset{7}{V}$  I G II  $\overset{7}{V}$  I F  $\overset{7}{V}$  I C II  $\overset{7}{V}$

\*1) The last chord of the old key is everywhere, excepting at Note \*3), a tonic chord, and in every case common to the new key; hence, the modulations are diatonic. — \*2) Par. 300c. — \*3) The last chord in Ab here appears to be a V instead of I. It is, however, plausible to regard the preceding chord, on the *accent*, as the one which concludes Ab (as I). In this case the *unaccented* I<sub>2</sub> begins the following key. — \*4) Here the I of the old key does not appear in the new key, hence the chromatic progressions. — \*5) Par. 300b.

FUNDAMENTAL PRINCIPLES.

Key-relations are defined, fundamentally, by *signature*.

The five next-related keys are those whose signatures most nearly agree with that of the principal key.

It is best to abandon a key at one of its *tonic chords* and enter the new key through any of its *dominant*, — or second-dominant, — chords; rarely through the *accented* I<sub>2</sub>.

A modulation is diatonic when the last chord of the first key belongs also to the coming key, — otherwise it must be chromatic.

EXERCISE FORTY-FIVE.

A. Play the following chord-progressions on the piano, in the usual manner (the *bass alone* in the left hand):

$$C I - F \overset{7}{V}_1 - I \parallel C I - G V - I \parallel C I - a \overset{7}{V} - I \parallel C I - e \overset{7}{II}_1 - V - I \parallel$$

$$C I - \overset{8}{V} - VI - d \overset{9}{V}_0 - I \parallel G I - C \overset{7}{V}_3 - I_1 - G \overset{7}{V} - I \parallel a I - \overset{3}{V}_1 - I \parallel e \overset{7}{I}_2 - IV_1 - V \parallel I \parallel$$

$$F I - IV_1 - I_2 - d \overset{9}{V}_0 - I - g \overset{7}{V}_0 - I \parallel b I - V - I - A \overset{7}{II}_3 - \overset{7}{V}_1 - I \parallel.$$

B. Modulations into next-related keys. All changes of key should be marked, and their relations analyzed; also the chords used in modulating. Do not neglect the accidentals. The accidentals make the modulations, — see par. 288.

a.

b.

c.

d.

e.

HÄNDEL

6. 7.  $\times$

8. MENDELSSOHN 9. 10.

$\left\{ \begin{array}{l} g \overset{\circ}{V}_0 \\ 7 \sharp \sharp \\ c \text{ IV}-V-I \end{array} \right.$ 
 $e$ 
 $e \overset{\circ}{V}_0-I$ 
 $\left\{ \begin{array}{l} e \overset{\circ}{V}_0 \\ 7 \sharp \sharp > \\ C \text{ II}-I_2 \end{array} \right.$

$\left\{ \begin{array}{l} 7 \sharp \sharp \\ Bb \overset{\circ}{V}_0-gII_2-I \end{array} \right.$ 
 $\left\{ \begin{array}{l} 7 \sharp \\ C \text{ II} \\ a \text{ IV}-V-I \end{array} \right.$ 
 $\left\{ \begin{array}{l} 7 \sharp \sharp \\ C \text{ II} \\ F \text{ VI}-V-I \end{array} \right.$

\*1) This altered chord (with raised 2nd and 4th steps) is purposely used three times in succession; twice as unmistakable *altered* chord in C, and then, at  $\times$ , as *legitimate* chord in e. — \*2) This modulation might, it is true, be demonstrated according to the fundamental rule (par. 302). But it is evident that the altered chords in the preceding measures were the incentive to the modulatory chord chosen for the final transition. The following example will also admit of simpler analysis; but the rest, from No. 3 to No. 10, cannot be accounted for in any other way than as modulations *through altered chords*. — \*3) Lowered 2nd step. — \*4) Here the transitional chord is first legitimate (in G), and is then transformed into an altered chord (with raised 6th step) in a minor, — as the *progression* proves. — \*5) This is exactly (and purposely) the reverse of No. 1. The transitional chord is *first legitimate* in e, and then becomes, at  $\times$ , an *altered* chord in C. — \*6) The transitional chord is mixed, in both keys. — \*7) Altered in *both* keys, — raised 4th step in C, raised 6th step in a minor. — \*8) Raised 2nd and 4th step in C, used as raised tonic and 6th steps in F.

#### EXTRANEOUS MODULATIONS. — 1. Through Next-related Keys.

305. A modulation is extraneous when it extends *past the next-related keys*; or, in other words, into a key whose signature differs by more than one accidental from that of the abandoned key.

The *fundamental* rule for such remote modulations is, to progress in *successive stages*, through the *intermediate next-related key or keys*, along the lines of the “circle of keys”; that is, through the *signatures* which occur successively in the direction of the ultimate key.

For instance, the modulation from G major (1 sharp) into A major (3 sharps) would be made through the key of 2 sharps, thus: G—D—A, or G—b—A.

\*1) \*2)

\*1) It is not necessary to adhere to the same *mode*: on the contrary, it is advisable to alternate (more or less regularly) between major and minor, as at \*2).

Or from C (natural scale) into A $\flat$  (4 flats), through 1, 2 and 3 flats, thus: C—F—B $\flat$ —E $\flat$ —A $\flat$ ; or C—d—B $\flat$ —c—A $\flat$  (Ex. 229 — 2); or C—F—g—E $\flat$ —A $\flat$ , etc.

And from *E* (4 sharps) into *b♭* (5 flats), through *5♯*, *6♯* or *6♭*, thus: *E-B-F♯* or *G♭-b♭*; or *E-g♯-F♯* or *G♭-b♭*, etc. For illustration:

Ex. 229.

1.  
C-e-b-A  
C e<sup>9</sup> V<sub>0</sub> b<sup>7</sup> VI-V A<sup>7</sup> V<sub>0</sub>

2.  
C-d-B♭-c-A♭  
C d<sup>9</sup> V<sub>0</sub> B♭<sup>7</sup> V c<sup>9</sup> V<sub>0</sub> A♭ IV-V

EXERCISE FORTY-SIX.

a. 3 8\*1) +3 63 +3 8 3

b. \*2)

d. +3 \*3) 3 5 \*4) -8 c. +8 7

f. +3 3+3 8

The image shows a bass line in G major (one sharp) with a time signature of 3/4. The melody is written in a single staff. Below the staff, figured bass notation is provided for each measure. The figures are: G, 87, 65, 4#; B, 7, #; B, 7, #; 5+3, 5, #; \*a), b, b, 7, b; 5+3, 5, #; +8, b, b, 7, b; -8, b, b, 7, b. The piece ends with a double bar line and the word "Plagal" written above the final measure.

\*1) Altered II of *F* and altered IV of *d*. All the modulations in this bass are made through altered chords, and must be analyzed accordingly. — \*2) Unfigured bass (par. 264B). A modulation occurs at each \*. — \*3) During the first three measures this bass modulates in regular degrees “downward,” *i.e.*, adding a new flat each time. At \*3), instead of going on into 6 flats it *turns back* into 4 flats, and then resumes the original downward direction. This is done to avoid the monotony of several successive changes in the same direction. At \*4) the monotony is again broken by the “horizontal” modulation into the relative key. — \*5) The signature (5#) is omitted, because of the subsequent modulation into flat keys. — \*6) Here the notation is changed from 7# to 5b; the key is regarded, in musical practice (and on the keyboard) as the same.

Add Original phrases.

EXTRANEOUS MODULATIONS. 2. Direct.

306. There are cases where, contrary to the general rule, the remote key is reached *directly*, instead of through successive intermediate keys. The most common of these is a modulation called, in this book,

THE MODULATORY STRIDE.

307. The “stride” is a harmonic degree (perfect 5th) *downward* from a *major* keynote, or *upward* from a *minor* keynote, with *change of mode*. In other words, it is the subdominant-minor from major, and (exactly reversed) the dominant-major from minor. Thus:

The example shows a melodic line in C major and C minor. The notes are: C (min.), G (maj.), G (maj.), C (min.), d, A, F, bb, Ab, (bb) or #, c#. The notes are labeled with 'min.' and 'maj.' above them. The text 'Ex. 230.' is on the left, and 'etc.' is on the right. Below the notes, the letters 'c', 'G', 'G', 'c', 'd', 'A', 'F', 'bb', 'Ab', '(bb) or #', 'c#' are written.

The keys lie four degrees apart (c—G, 3b—#), but the stride-relation is *quite as intimate as any next-related key*, — because of the important harmonic coincidences; chiefly that of the I and V: Therefore, this modulation can be made with the same ease as those between next-related keys.

The diagram shows two chords: C major (C-E-G) and C minor (C-Eb-G). Below them, the text reads 'c V = G I', indicating that the V chord of C minor is the same as the I chord of C major.

The formula to be memorized is: any perfect fifth, of which the *upper* tone stands for a *major* keynote, and the lower for a *minor* one (Ex. 230), indicates the “stride.”

308. The stride is generally made according to the fundamental rule, leaving the first key at its *tonic chord* (the I, but *not* the VI, in this case), which is at the same time invariably a principal triad of the desired key. Thus, in the stride C—f, for instance:

The image shows three musical examples of the stride from C to f. The first shows the C I chord (C-E-G) and the f V chord (f-A-C). The second shows the f I chord (f-A-C) and the C IV chord (C-E-G). The third shows the C II chord (C-Eb-G) and the f VI chord (f-A-C). Below each pair, the text reads: 'C I = f V', 'f I = C IV', and 'C II = f VI'.

Ex. 231.

1. C—f  
2. f—C  
3. e—B—e  
4. *Allegro*  
5. C—f

C I f V      f I C IV— $I_2$       e I B V—I      e V—I

bb—F—bb      SCHUMANN      C

bb VI—II—V      FI I<sub>2</sub> V      b b V V I      C II      f VI—V I

\*1) An altered chord (lowered 6th step of C). — \*2) The facility of the stride is strikingly shown in this example, where it is made forward and backward in three beats. When, as here, the I of the old key is at the same time the dominant chord of the new one, there is no need of delaying the modulation. — \*3) In this exceptional example of the stride, the order of chords is reversed; *i.e.*, the first key is abandoned at its V, and the new key is entered through the I.

MODULATION TO THE OPPOSITE MODE. (EXCHANGE OF MODE.)

309. The change called, in this book, the opposite mode, is, strictly speaking, not a change of *key*, but of *mode only*, — for example, from C major to c minor, or reversed. It is not to be confounded with the *relative* major, or minor, which is a wholly different key.

The opposite mode is defined in par. 101. By signature, there is a difference of three degrees between the opposite modes (E—e, 4#—#) in *location*, though in *relation* they are practically identical. This appears to place each minor key at two different points in the modulatory system, which may be interchanged or not, at option. Thus, c minor may represent the locality (tonality) of “three flats,” or it may pertain to the region of C, as transient modified form of the latter. (This has been its significance in all foregoing examples.)

310. a. The modulation to the opposite mode, either way, is generally made through *dominant* chords, which are mostly common to both modes; see Ex. 68, Note \*1); par. 202; 229; Ex. 198, Note \*3).

b. But the altered chords with *lowered 6th step* (in major) are also available, and extremely convenient. Thus:

	good	better	
C V	$\overset{7}{V}$	C $\overset{7b}{V_0}$	$\overset{7b}{II}$ $\overset{b}{IV}$
c V	$\overset{7}{V}$	c $\overset{7}{V_0}$	$\overset{7}{II}$ $\overset{7}{IV}$

c. Or the modulation may be made by a direct *chromatic* change from the one tonic triad to the other. Thus:

**311.** This modulation is very different from the stride, and is far from being as natural and easy as the latter. The change from minor into major is always good, but from major into minor is much more difficult. The major mode is often substituted at the *very end* of minor pieces, in order to obtain a stronger perf. cadence (on the *major* tonic); see *Bach*, "Well-tempered Clavichord," prelude and fugue Nos. 2, 4, 6, etc., the last measure of each. It is also frequently used, either way, for the sake of striking contrasts.

**312.** When the *dominant* chords are used for the mod. into the opposite mode, they should appear on accented beats, and be *prolonged* as far as the rhythm will permit, so as to separate the conflicting mediant (maj. and min.) as widely as possible.

Ex. 232.

1. *Allegro* BEETHOVEN  
 2. *Andante* SCHUBERT

3. *Allegro* SCHUBERT  
 4. *Adagio* BRAHMS

5. *Sua Vivace* LISZT

The examples show various modulations and chord progressions:

- Example 1 (Beethoven):** Shows a modulation from minor to major and back to minor. Chords are labeled as  $b\bar{V}^7 - I$ ,  $b\bar{V}^7 - I$ ,  $A\bar{b}I$ ,  $a\bar{b}I$ , and  $\{ a\bar{b}V^7 \quad A\bar{b}V^7 - I \}$  over  $\{ E\bar{b}I - \bar{V} - I \}$ .
- Example 2 (Schubert):** Shows a modulation from minor to major. Chords are labeled as  $a\bar{b}I$ ,  $\{ a\bar{b}V^7 \quad A\bar{b}V^7 - I \}$ , and  $E\bar{b}I - \bar{V} - I$ .
- Example 3 (Schubert):** Shows a modulation from major to minor. Chords are labeled as  $D I$ ,  $d I$ , and  $B\bar{b}\bar{V}^7 - I$ .
- Example 4 (Brahms):** Shows a modulation from minor to major and back to minor. Chords are labeled as  $a$ ,  $A$ , and  $a$ .
- Example 5 (Liszt):** Shows a modulation from d minor to D major and back to d minor. Chords are labeled as  $d \text{ min.}$ ,  $D \text{ maj.}$ ,  $d \text{ min.}$ , and  $\{ d\bar{V} \quad D\bar{V} \}$ .

\*1) This dominant chord, prolonged through the measure, is common to both modes, so it is simply a question whether the distinctive mediant (the letter *d*) shall be *major or minor* in the resolving chord. — \*2) Here the opposite mode is reached chromatically, — par. 310c. — \*3) The stride. — \*4) The change is made chromatically. It serves here to shorten the distance from *D* to *Bb*, which, according to par. 305, would require the intermediate keys *G*, *C* and *F* (or their relatives). \*5) Par. 310b; IV of *a* minor, and altered IV of *A* major. — See also Ex. 235 - 3.

**313.** The exchange of mode, seen above, is liable to take place *after any dominant chord, at any point in the phrase*, — only excepting after the *major dom.-9th* (par. 229). The coincidence of the dom. chord-class in the two modes is thus turned to advantage for many reasons; chiefly, as a means of shortening the route into remote keys. For example:

Ex. 233. *i. Allegro* BEETHOVEN, Op. 73 2.

minor min. min. etc.

E { E<sup>7</sup> V } { e IV — 7 — g I 7 — f I 7 } a { A I }  
 { e V — I } { G II — V — F II — V — Eb II V } { d V — I }

\*1) The modulatory outline of this example: E — e — G — F — Eb, would be incorrect, were it not for the ingenious manner in which the ambiguity of the  $\overset{7}{V}$  is utilized in substituting the *minor* mode each time for the expected major; thus: E  $\overset{7}{V}$  — e } — G  $\overset{7}{V}$  — G } — F  $\overset{7}{V}$  — f } — Eb.

\*2) The *major* mediant (*c#*) is substituted for *c#* because of the coming *d* minor.

See further: Schubert, "Schöne Müllerin" (vocal, op. 25), No. 17, in which there is frequent exchange of mode throughout, in effective adaptation to the character of the words (see meas. 2-3, 4-5, 18, 21-22, 36-38, 40-41, 45-46, etc.). Also Chopin, *A*-minor waltz, op. 34, No. 2, meas. 53 to 84.

**314.** As the stride is almost exactly equivalent to a next-related modulation, it is evident that its application as *intermediate key*, in extraneous modulations, conforms sufficiently to the fundamental rule given in par. 305. Its use in this capacity is very advantageous, because it shortens extreme distances materially (being a direct transition of 4 signatures), and relieves the monotony of regularly succeeding signatures.

For instance, instead of the long-winded and monotonous successions *C—F—Bb—Eb—Ab—Db—Gb*, the same end may be reached thus: C —  $\square$  — *f—Db—Gb*; or: C —  $\square$  — *F—bb—Gb*. (The  $\square$  indicates the stride.) Also, from *C* to *F#*, thus: C —  $\square$  — *e—B—F#*. From *D* to *F*, thus: D —  $\square$  — *g—F* (Ex. 234-2). From *C* to *A*, thus: C —  $\square$  — *a—E—A*, (*past* the desired key, and back); or: C —  $\square$  — *d—A* (Ex. 234-1). For example:

Ex. 234.

1. C— $\overline{d}$ —A                      2. D— $\overline{g}$ —F

BEETHOVEN

\*1)

C                      d V-I                      D                      { D I / g V - I }                      F V-7

A IV-I<sub>2</sub>                      V

\*1)  $F\sharp$  in the tenor (as lowered 6th step of  $A$ ) would prolong the impression of the former key ( $d$  minor) and make the mod. smoother.

In determining the shortest route to be taken in an extraneous modulation, it is first necessary to ascertain the *distance* and the *direction*, according to the table on the margin. For instance: from  $A\flat$  to  $b$  is six degrees *upward*. If, as here, the distance exceeds *three* degrees, it is advisable to shorten the modulation by using the stride; but otherwise it is not necessary, and the route may be taken, as usual, through successive signatures. In a remote mod. *upward* from a *major* key, the stride can not be employed directly, for obvious reasons,—the stride is *downward* from major; therefore a transition must first be made into a next-related *minor* key, from which the upward stride will be possible. The same applies inversely to a remote mod. *downward* from a *minor* key.

For example, from  $C$  to  $g\sharp$ , thus:  $C$ — $\overline{e}$ — $B$ — $g\sharp$ ; or  $C$ — $\overline{a}$ — $E$ — $g\sharp$ . From  $f\sharp$  to  $B\flat$ , thus:  $f\sharp$ — $\overline{D}$ — $g$ — $B\flat$ ; or  $f\sharp$ — $\overline{A}$ — $d$ — $B\flat$ .

EXERCISE FORTY-SEVEN.

A. Indicate, in *letters* (as shown above), the *shortest possible routes* which may be taken in effecting the following extraneous modulations. *Only the stride*, not the opp. mode, is to be used in shortening the distance.

Maj.	min.	signatures
$A\flat$		
$D\flat$		
$G\flat = F\sharp - d\sharp$		6#
$B - g\sharp$		5#
$E - c\sharp$		4#
$A - f\sharp$		3#
$D - b$		2#
$G - e$		#
$C - a$		o
$F - d$		b
$B\flat - g$		2b
$E\flat - c$		3b
$A\flat - f$		4b
$D\flat - b\flat$		5b
$G\flat - e\flat = d\sharp$		6b = 6#

Downward ↓                      ↑ Upward

From $C$ to $E\flat$	From $d$ to $A\flat$	From $E$ to $g$	From $f\sharp$ to $E\flat$	From $A\flat$ to $G$
" $c$ " $F$	" $D$ " $E\flat$	" $E$ " $D\flat$ *1)	" $G\flat$ " $F$	" $A$ " $e$
" $C\sharp$ " $g\sharp$	" $D$ " $g\sharp$	" $e$ " $F\sharp$	" $G\flat$ " $c\sharp$ *1)	" $a$ " $B$
" $c\sharp$ " $D$	" $e\flat$ " $c$	" $e$ " $f$	" $G$ " $g$ *2)	" $B\flat$ " $E$
" $c\sharp$ " $F\sharp$	" $e\flat$ " $F\sharp$ *1)	" $F$ " $E$	" $G$ " $D\flat$	" $b\flat$ " $B\flat$
" $D\flat$ " $g$	" $E\flat$ " $d$	" $F$ " $G\flat$	" $g\sharp$ " $b$	" $B$ " $f$ *1)
" $d$ " $A$	" $E\flat$ " $C\flat$	" $f$ " $b$	" $g\sharp$ " $a$	" $b$ " $E\flat$
		" $F\sharp$ " $e$	" $g$ " $D$	" $B$ " $C$

\*1) It must be remembered that  $6b$  and  $6\sharp$  are alike. — \*2) *Not directly*; the opposite mode is not to be used.

B. Work out each of the above modulations, along the adopted route, in **Original phrases or periods**.

C. Basses. To be worked out and analyzed as usual.

\*1) C# major is substituted for c# minor. — \*2) Similar to Note \*1), c for C, and F for f. — \*3) IV of d#, mixed. — \*4) Unfigured bass (par. 264B).

MODULATIONS AT CADENCES, AND IN SEQUENCES.

315. a. The reason assigned in par. 302 for leaving a key at one of its tonic chords was, that the latter fulfil all the obligations of their key and leave no obstacle in the way of an exchange of basis. Also, preference is given to the tonic chords on accents, because these are the actual points of rest in the rhythmic oscillation, — the points where all cadences, transient and final, are made.

b. Nowhere is the impression of completion stronger than at the cadences themselves, or even at those points of transient interruption in the course of a sentence which mark the end of a section of the form, — the “joints” between the members and figures of which the melody is compounded.

316. Hence it is, that a modulation may be made with the greatest ease at any cadence (i.e., after the cadence-chord). And it is so reasonable to begin a new phrase, or a new melodic member, with a new key, that the transition may be made abruptly, and without regard to the fundamental rule of modulation.

The only limitation is, that there shall be a reasonable degree of affinity between the two keys, — or between the melodic members (as in the sequence). The modulation may, and often is, made from the last chord of the first key (which is likely to be tonic or dominant) *directly into the I of the next key*. (Comp. par. 300c, where this is defined as very irregular. The *cadential break of connection* renders almost any change feasible.) For example:

Ex. 235.

1. cad. SCHUMANN 2. cad. SCHUBERT

B♭ I G♭ I A I F I

3. *Allegro* cad. MOZART

A I a I B♭<sup>7</sup> V etc.

4. *Adagio* cad. MENDELSSOHN 5. cad. SCHUMANN

F I d<sup>9</sup> V F I A♭ VI — 7<sup>IV</sup> — V

6. *Adagio* SCHUBERT

C<sup>7</sup> V I IV I D♭ III I D III I

\*1) An immediate progression from one tonic chord into another. — \*2) The opposite mode. — \*3) There is no relation between these keys (*a-Bb*). But there is an important common tone, *a*, which is the tonic of the first key, and the leading-tone of the next. This affords the desirable affinity, and is, in general, a significant feature of all free modulation, — to be explained later in detail (see par. 346). — \*4) Common tone *a*, third step of *F*, fifth step of *d*. — \*5) Common tone *c*, tonic of first key, leading-tone of the next. — \*6) The common tone *db* is changed to *c#*; the result is the same.

Such modulations as these might more aptly be called “modulatory leaps,” than legitimate changes of key.

317. On this same principle, and with similar ease, modulations may be made *by sequence* (par. 260, and, particularly, par. 261). The original member and its sequential reproduction are of course separated by a “joint” or transient cadence, at which any change of key may take place; and the desirable affinity is fully provided by the sequential agreement of the members.

Ex. 236. MENDELSSOHN

Chord progressions for Ex. 236:  
 System 1:  $A^b I$   $\overset{7}{V}$   $I f I$   $\overset{7}{V}$   $I$   
 System 2:  $A^b$   $A^b V$   $D^b I$

 System 1:  $d IV$   $II$   $I$   
 System 2:  $f IV$   $II$   $I$   
 System 3:  $g^\# IV$   $II$   $I$   
 System 4:  $b IV$   $II$   $I$

CHOPIN

5. *Allegro*

\*5)      Seq.      Seq.      etc.

Eb I                      g I                      Bb I                      d I

\*1) Ex. 235, Note \*1). — \*2) This modulation is very abrupt, and the keys in no sense related. Such unusual transitions could scarcely be effected anywhere but at a melodic "joint," and by sequence. — \*3) This third group is not an *exact* sequence of the preceding one, nor is this necessary. General similarity of melodic or harmonic progression, or a *partial* sequence, is all that the ear demands. — \*4) Étude, op. 25, No. 10, 8 meas. from the end. Given here in simplified form. — \*5) The tones marked x are "grace-notes." The student may read from par. 395 to par. 401, and is at liberty to apply them here, if he chooses.

See also Ex. 235-6; Ex. 239c. There is an analogy between these examples and Ex. 90, Note \*2).

EXERCISE FORTY-EIGHT.

Modulations in sequences and at cadences, into related and remote keys. To be worked out and analyzed as usual.

BEETHOVEN

a.      b.      c.      d.

Add a large number of Original phrases and periods.

SECTION 3. CHROMATIC PROGRESSION, AS A SPECIAL MODULATORY AGENT.

318. *a.* A progression is chromatic when the *same letter* is inflected upward or downward by an accidental, thus: *g-g#*, or *g-gb*, and reversed.

*b.* The result of such an inflection is greater than it appears to be, and can be appreciated only by comparing the two tones as *keynotes*. This test proves that every chromatic progression is *actually a leap of seven degrees*; thus *G* (1#) and *Gb* (6 flats); or *Ab* (4 flats) and *A#* (3 sharps). See par. 166.

*c.* The chromatic inflection, for which there is no apparent *theoretical* justification, is excused on *practical* grounds; namely, the difference in pitch is so slight that the ear readily follows the change. It is a case of "relation by proximity."

319. The chromatic progression has been used constantly, in the foregoing exercises, but merely as a result of the fundamental rule, or other ordinary condition, of modulation. It may, however, be the direct *cause* of the change, and it is in this specific capacity that chromatics are here being considered.

320. **Chromatic chord-progressions** (those in which one or more of the parts progress chromatically) may be distinguished as *simple* or *compound*.

In a *simple* chrom. chord-progression the chord does not change its *form*. In compound progressions there are diatonic as well as chromatic successions, so that the chord assumes a new shape. For illustration:

Ex. 237.

\*1) The simple change of *e* into *eb* does not alter the *form* of the chord, which is the triad *c—e—g* both before and after the chrom. movement. — \*2) Simultaneously with the chrom. change *e—eb* in soprano, there is a diatonic progression *c—bb* in bass, whereby the chord-form is changed from a triad to a ch. of the second.

RULES OF CHROMATIC PROGRESSION.

321. The rules of chromatic inflection have already been given in par. 269e. They are recapitulated here, for convenience:

*a.* The chrom. inflection is usually made in *the same part*.

*b.* The note to be inflected *should not be doubled*, as a rule. If it is doubled, one part moves diatonically, — *not with a leap*, — opposite to the direction of the chrom. change.

*c.* The chrom. progression *should be approached in the corresponding direction*, if possible.

Ex. 238.

322. The violation of par. 321a occasions the so-called *cross-relation*. It is never wrong when the first of the two chromatic tones *does not leap*; and is often mitigated by other conditions, — when it occurs at a "joint" or cadence, — or when the first tone is in *bass*, — or when the change occurs in different parts but in the same register. For example:

Ex. 239.

BEETHOVEN

SPONTINI

\*1) These two examples are inexcusable. — \*2) The leap in *bass* seems permissible, probably because the bass is always to some extent independent of the other parts. — \*3) All permitted, because the first of the two chrom. tones *does not leap*. — \*4) Sequence modulations; the cross-relation is separated by the "joints." — \*5) Limited to instrumental music; the cross-relation is present, but the ear does not detect it. — \*6) These cross-relations all occur on the same beat, in successive measures, and seem justified on grounds similar to Note \*4). Another peculiar case appears in Ex. 244-5.

#### CHROMATIC CHORD-PROGRESSIONS.

**323.** The entire system of chord-succession is divided into two radically distinct domains, the **diatonic** and the **chromatic**.

To the **diatonic domain** pertain all relations and associations between **any two chords which belong to the same key**. Here, the quality and permissibility of the chord-successions may be, and are, determined by natural harmonic principles, because their relations are defined from a common centre (their tonic). These rules of diatonic chord-succession are given in Parts I and II; they are incontestably necessary and just, and must constitute the legitimate *basis* of all harmonic thought. "Diatonics" is the domain of harmonic law and order.

To the **chromatic domain** pertain all connections between **any two chords which belong peculiarly to different keys**. Here, no natural law of chord-succession can be laid down and defended, because the chord-relations cannot be defined from a common centre; *any imaginable succession is possible*, and it is difficult even to systematize, in some degree, the almost inexhaustible multitude of possibilities in this domain. "Chromatics" is the domain of harmonic lawlessness.

While the chord-associations in the diatonic sphere are the unconstrained consequence of *natural* conditions, the chord-associations in the chromatic sphere are a direct violation of these natural conditions, and are effected by *artificial* means (*i.e.*, by means of the apparently delicate, but in reality most powerful, chromatic "lever," which inflects the chord in such a way as to destroy its contact with its tonic and cancel its obligations to the latter).

*a.* The chromatic inflection may be made in *either direction* (upward or downward).

*b.* It may be applied to *any chord-interval* (root, third, fifth; seldom seventh or ninth, and chiefly downward, in these intervals).

*c.* It may be applied to almost *any two chord-intervals* at once, or even to *all three* (of a triad) at once. In this case the inflections are generally made in the same direction, though it is also possible to

inflect one interval upward and another downward; and, if all three are inflected, the chord must be in inverted form.

d. It may be applied to *any* chord; best, to a *tonic* chord, major or minor (Ex. 241a); or to a *sub-dominant* or *dominant* triad (Ex. 241b); or to the *dominant-seventh* or *dom.-ninth* (Ex. 241c); or even to *other 4-tone chords* ( $II^7$ ,  $IV^7$ ,  $VI^7$ ).

e. The chrom. chord-progression may, finally, be either simple or compound, more commonly the latter. For example:

a. From the major triad:

Raised root      Lowered root      Lowered 3rd      Raised 3rd (and 5th)

Ex. 240. 

G I    a V<sub>7</sub>    B<sub>b</sub>    c<sup>#</sup>  
 C V    A "    b<sub>b</sub>  
 D IV    f<sup>#</sup> II  
 b VI  
 c V

Raised 5th      Lowered 5th      Lowered 5th and 3rd      Raised root, lowered 3rd      All raised      All lowered

e      G<sub>b</sub>      A<sub>b</sub>      d IV      E<sub>b</sub>      f<sup>#</sup>

b. From the minor triad:

Raised root      Lowered root      Raised 3rd      Lowered 3rd and root      Raised 5th

a I    e IV    G II    F III    E<sub>b</sub>  
 e IV

c. From the 7<sup>th</sup>:

Raised 5th and 3rd      Lowered 5th      All raised      All lowered      Raised root      Lowered 3rd

and 5th      Raised 5th      Raised 7th, and 5th.      Lowered 7th, 5th and 3rd      All raised      All lowered

C V<sup>7</sup>      G      e      A<sub>b</sub>

d. From the V<sub>0</sub>, major:      e. From the dim. 7th:

Lowered 3rd and 5th      Lowered 9th      Raised 5th and 7th      Bodily downward,      upward

etc.

It is needless and futile to continue this table, for it is well-nigh inexhaustible. It is left to the investigation of the student.

The rules governing the technical act are given in par. 321; but the guides through this maze of "wandering" harmonies, the choice, and extent of their use, — these can be dictated only by the taste, tact and good judgment of the student. But see par. 324 and 325. Also par. 426.

Ex. 241.

a. From tonic chords :

C I G      C VI d      a I d      a VI e

b. From First- and Second-class chords :

C V a      C IV e      C II<sub>1</sub> G      a V F      a IV C

c. From dom.-discords :

C V<sub>7</sub> a      c V<sub>7</sub><sup>o</sup> f      a V<sub>7</sub><sup>o</sup> F      C V<sub>7</sub><sup>o</sup> d

d. SCHUMANN      e. SCHUMANN

D I A V<sub>7</sub><sup>o</sup>    I e IV<sub>7</sub>    V<sub>7</sub>      D V<sub>7</sub> B<sub>b</sub>    V<sub>7</sub>

\*1) In each case the 3rd of the major I is lowered. — \*2) Lowered 3rd and 5th in the dom.-7th.

## EXERCISE FORTY-NINE.

Construct a large number of **Original phrases**, utilizing the chrom. material given in Ex. 240, — but from different keys. Or the student may be guided by the *text* (par. 323a — e), and make his own chromatic experiments, without reference to the example.

**324.** Among the many curious and exceptional results which attend the use of chrom. changes, there are two which require special consideration, namely:

a. 1st: Chrom. progressions are not necessarily limited to the next-related modulations, but often lead *immediately, and easily, into remote keys*. Such irregularities, though possible results of chrom. agency, can of course be admitted only when obviously justified by circumstances. For instance:

Ex. 242.

The musical score for Ex. 242 consists of two systems of piano accompaniment. The first system shows a chromatic progression of chords: C major (C), C minor (c), C major with a flat second degree (C D b), and C major with a sharp second degree (C F #). The second system shows a similar progression: C major (C), D major (D), E major with a flat second degree (e F), and E major with a sharp second degree (e c #). The score includes treble and bass clefs, a common time signature, and various chromatic alterations in the notes and chords. Annotations \*1), \*2), \*3), and \*4) are placed above the notes to indicate specific modulations.

\*1) These modulations are all made according to the *fundamental rule* (par. 302), — from a *tonic chord*. — \*2) A modulation of six degrees, the most distant that can be made in one move. — \*3) The altered II of D. — \*4) May just as well be C# major (with e# in alto).

b. 2nd: By means of the chrom. inflection, *the dominant-discords may evade their legitimate resolution*, in their own key, and be led into other keys. The conditions upon which this extraordinary (though very common) modulatory progression is allowed, are:

First, that the dom.-discord should, as a rule, be led chromatically *into another dom.-discord*, — *i.e.*, into a counterpart chord, with similar obligations in another key; and

Second, that the obligations of the first chord should be resolved as fully as possible, — *i.e.*, the 7th and 9th should descend, or remain stationary, and the leading-tone ascend, or remain.

c. There are, naturally, some exceptions to these rules, which, in common with other peculiar successions, must be placed, roughly, to the account of "chromatics."

The following table illustrates the progression of the dom.-discords of *C* major into those of all the other keys, in the order of preference:

Ex. 243.  
\*1)

Chords shown in Ex. 243:

System 1:  $C^7$ ,  $F^7$ ,  $C^7_{b9}$ ,  $F^7$ ,  $C^7_{b9}$ ,  $F^7_{b9}$ ,  $C^7$ ,  $F^7_{b9}$ ,  $C^7$ ,  $a^7$ ,  $a^9$ ,  $d^7_{b9}$ ,  $C^7$ ,  $d^9$ ,  $b^7$

System 2:  $A^b_7$ ,  $A^b_9$ ,  $D^b_7$ ,  $B^b_7_{b9}$ ,  $E^b_7$ ,  $C^7_{b9}E^b_7$ ,  $G^7_{b9}$ ,  $E^b_9$ ,  $F^{\#}_7$

\*1) These chords, excepting \*4), can be connected in *any inversions*. — \*2) The seventh is resolved diatonically downward. — \*3) The dom.-discords, it will be recalled, are the same in major and minor. These first chords may also be *c minor* and *f minor*. — \*4) These progressions are good only in this arrangement of parts. — \*5) Passive resolution of the seventh. — \*6) The seventh progresses chromatically *upward*; this is very rare. — \*7) An “enharmonic” change; par. 328.

Comparison of these various successions will reveal the fact that the best progressions are those in which

- (a) the 3rd of the first dom.-7th is lowered, or
- (b) the root is raised. See Ex. 240c; Ex. 241c.

The other chrom. inflections are possible, but all more or less rare.

**325.** When one dom.-discord is led chromatically into another, in this manner, the *second one is generally resolved into its tonic chord*. But it is also possible to progress *again*, chromatically, into a third dom.-chord, and so on.

Such **continuous chrom. chord-progressions** are least confusing when they constitute more or less exact *sequences*; and, in any case, *some thread of connection must be pursued in some part or other, best in soprano or bass*; as for instance, the descending progression of the soprano in Ex. 244-1, in regular chrom. succession; and the regularly ascending chrom. succession in No. 2 (bass), No. 3 (soprano), No. 9 (bass); and the bass-sequences in Nos. 4 and 6.

For illustration:

Ex. 244.

Chords shown in Ex. 244:

1.  $C^7$ ,  $F^7$ ,  $B^b_7$ , etc.

2.  $C^7$ ,  $a^7$ ,  $D^7$ , etc.

4. *Allegro* BEETHOVEN

5. BEETHOVEN 6. HÄNDEL

7. *Andante* BRAHMS 8. *Allegro*

9. *8va* WAGNER

\*1) The second chord of each pair of successive dom.-7ths conforms exactly to the normal resolution of the first one, excepting that a *new seventh is added*, each time. This succession is placed at the head of Ex. 243, as the best; and its continuous occurrence in interlinked sequences, as here, is as simple and natural as anything in "chromatics" can be. — \*2) Chords of the *diminished seventh* in chromatic succession. — \*3) These extraordinary cross-relations seem to be justified, partly, by the sequential arrangement; but they would scarcely be possible in any other succession than that of *dim.-7th chords*, — defined in par. 239c as the most flexible in all harmony. — \*4) Cases of this kind, where the V of one key progresses chromatically into the I of another key, are very rare; see par. 324c.

326. Besides the consecutive dom.-7ths and dim.-7ths, other chord-forms may appear in direct succession, through chromatic agency; but strictly according to the principle enunciated in par. 325, — some connecting thread should be pursued, in soprano or bass.

a. Probably the most common of these is the chromatic succession of *chords of the 6th*, in either direction. Comp. par. 156.

Ex. 245.

1. *Allegro* CHOPIN  
 2. *Mod.* VERDI 3. *Allegro* CHOPIN  
 Chords of the 6th:  $A^b$ ,  $B^b$ ,  $C^b$ ,  $D^b$ ,  $E^b$ ,  $B^b$ ,  $C$ ,  $C^\sharp$ ,  $D$ ,  $D^\sharp$ ,  $E$

\*1) The notes marked x are grace-notes. — \*2) Pfte. sonata in  $b^b$ , op. 35, *Scherzo*, meas. 37, 38; see also the following 11 measures. — See Ex. 282, No. 10.

b. Successive dom.-7ths, uninverted;

c. Successive 4-3 chords;— and so on.

Ex. 246.

*Allegretto* CHOPIN \*1) *Moderato* SCHUMANN  
 Chords: 7, 7, 7, 7, 7, 7, 7, 7, 7, 7, 7, 7

\*1) Mazurka, op. 30, No. 4, near the end, — 4 measures in succession. The very unusual array of perfect 5ths is justified by general artistic conditions. Grace-notes marked x.

327. The above examples illustrate *passing modulations* of the most transient kind. In many cases the keys are represented by *no more than one single chord*. This should not be regarded as a contradiction of the principle enunciated in par. 267e (which review). It remains a fact, that *one isolated chord does not completely define a key*, but is dependent upon the chords which precede and (especially) which *follow* it, for its absolute identification. This is demonstrated in Ex. 228.

But when, as in this example, the adjoining chords are **chromatic**, and therefore confirmatory neither of the middle chord nor of each other, then of course there is no alternative but to define each single chord *by conjecture*, according to the key which it reasonably suggests. The choice between the two opposite modes is almost always quite optional; Ex.

243, Note \*3). — Finally, when the succession is as rapid as in Ex. 244, No. 8, it is a question whether *any* definite change of key can be felt at all, or whether the whole is not a series of “passing chords,” — see later.

For interesting examples of chromatic succession the student is referred to **Bach**, Chromatic Fantasie, meas. 33-41; **Chopin**, Étude op. 10, No. 3, meas. 38-41; **Schumann**, Novellette op. 21, No. 3, meas. 43-49; **Wagner**, Overture to Tannhäuser, measures 17-30.

FUNDAMENTAL PRINCIPLES.

A chrom. inflection should be made in *one* part, and should be approached in the corresponding direction, as a rule.

The cross-relation is never wrong when the first of the two chromatic tones does not *leap*.

Through the agency of chromatics, any chord-progression becomes possible; remote keys may be reached directly; dom.-discords, and other bodies, may occur in direct succession.

The best chrom. inflections in the dom.-7th chord are the lowering of the 3rd, and raising of the root.

The dim.-7th chords connect with each other very flexibly.

EXERCISE FIFTY.

A. Make two tables, exhibiting the progression, 1st, from the I of C major (in any form) into the  $\overset{7}{V}$  or  $\overset{9b}{V_0}$  (as dim. 7th) of all other major keys; and 2nd, from the I of a minor (= VI of C) into the  $\overset{7}{V}$  or  $\overset{9b}{V_0}$  of all the other keys. Thus:

Table I

C-G      C-D      etc.

Table I shows two musical examples. The first, labeled 'C-G', shows a progression from a C major triad (C-E-G) to a G major triad (G-B-D) via a chromatic inflection of the third (E to F#). The second, labeled 'C-D', shows a progression from a C major triad to a D major triad (D-F#-A) via a chromatic inflection of the second (E to F#). The notation includes treble and bass staves with chord symbols and 'etc.' indicating further examples.

Table II

a-C      a-F      etc.

Table II shows two musical examples. The first, labeled 'a-C', shows a progression from a C minor triad (C-Eb-G) to a C major triad (C-E-G) via a chromatic inflection of the third (Eb to E). The second, labeled 'a-F', shows a progression from a C minor triad to an F major triad (F-A-C) via a chromatic inflection of the second (Eb to E). The notation includes treble and bass staves with chord symbols and 'etc.' indicating further examples.

B. Bases with chromatic modulations. To be analyzed, as usual.

Exercise B consists of three lines of musical notation in bass clef, each with figured bass below. Line 'a.' shows a progression starting with a C major triad (C-E-G) and moving through various chromatic modulations, including a 7th chord (F#-A-C) and a 9b chord (F#-A-C-Eb). Line 'b.' shows a progression starting with a C minor triad (C-Eb-G) and moving through various chromatic modulations, including a 3rd chord (F-A-C) and a 9b chord (F-A-C-Eb). Line 'c.' shows a progression starting with a C major triad (C-E-G) and moving through various chromatic modulations, including a 3rd chord (F-A-C) and a 9b chord (F-A-C-Eb). Line 'd.' shows a progression starting with a C minor triad (C-Eb-G) and moving through various chromatic modulations, including a 3rd chord (F-A-C) and a 9b chord (F-A-C-Eb). The notation includes treble and bass staves with chord symbols and 'etc.' indicating further examples.

C. Add a large number of **Original** phrases.

**SECTION 4. ENHARMONIC MODULATION.**

**328.** A progression is enharmonic when the next higher or lower letter is so inflected as to agree in sound with the original tone, thus:  $g\flat-f\sharp$ ;  $g\sharp-ab$ ;  $f-e\sharp$ ;  $c\flat-b$ ;  $g-f\sharp$  and  $a\flat\flat$ ; etc.

**329.** a. It is usually called the enharmonic "exchange" or "change", upon the universal assumption that it is not a "progression"; and this assumption is *practically* justified by the location of the tones on the pianoforte, where both enharmonic tones are produced with the same white or black key, and therefore are made to correspond exactly in pitch. Still, there is an actual difference, and, consequently, it is *theoretically* proper to call it a progression.

b. The actual difference in pitch equals twelve harmonic degrees: ( $f\sharp = 6$  sharps, and  $g\flat = 6$  flats. Compare par. 318b). Ex. 220 exhibits the actual enharmonic difference, at the keynotes  $F\sharp$  and  $G\flat$ ; and the dotted lines there indicate the manner in which it appears at other points in the modulatory circle also.

**330.** The enh. change involves an inevitable change of key, and therefore it is a modulatory factor. Thus,  $g\sharp$  is the leading-tone of *A* and tends towards the "sharp" keys; but  $a\flat$ , which is practically identical in sound with  $g\sharp$ , is the 6th scale-step of *c* minor and tends towards the "flat" keys.

**331.** Enharmonic chord-progressions, like the chromatic ones, are distinguished as *simple* or *compound*: simple, when the chord undergoes no other change than the enh. inflection; *compound*, when a diatonic or chromatic progression is made simultaneously with the enh. change. For example:

\*1) The enharm. change is divided between tenor and soprano; as it creates no cross-relation, it is allowed. And the progression in bass does not make the chord-progression *compound*, because it does not alter the sound of the chord. —

\*2) Here, on the contrary, there are diatonic progressions in alto and bass which produce an entirely new chord-effect. —

At \*3) all three species of melodic succession are simultaneously represented: *diatonic* in bass, *chromatic* in tenor, and *enharmonic* in alto. See Ex. 243, Note \*)7).

332. Compound enharm. chord-progressions are the most common, because the change of letter is so apt to destroy the chord-formation, and render readjustment necessary by other progressions at the same time.

SIMPLE ENHARMONIC CHANGES, WITH THE DIM. 7TH.

333. The best chord for simple enharm. changes is the **chord of the diminished seventh**, the properties of which in this particular are so remarkable and manifold that it is often called the "enharm. chord."

Its susceptibility of enharm. transformation is owing to its peculiarity of structure, — explained in par. 239*b*, *c*, and *d*. As the chord always sounds the same in every shape (whether the leading-tone appears at the bottom, or not), and as there is, consequently, no distinction whatever in sound between the intervals of the chord, it follows **that any (and each) of the four tones** of which the chord consists, **may be regarded as a leading-tone**. This, of course, involves a successive change of *key*, and, consequently, of *notation*; and this change of notation is "enharmonic."

Applied to the dim. seventh on *b*, the result will be the four minor keys — and also the four *major* keys; see Ex. 198, Note \*3) — of which the tones *b*, *d*, *f*, and *ab* (or *g#*) are respectively the leading-tones. Thus:

Ex. 248. \*1)

1.	2.	3a.	3b.	4.
Leading-tone <i>b</i>	Leading-tone <i>d</i>	Leading-tone <i>f</i> or <i>e#</i>		Leading-tone <i>g#</i>
Keys: <i>C</i> , <i>c</i> .	Keys: <i>Eb</i> , <i>eb</i> .	Keys: <i>Gb</i> , <i>F#</i> , <i>f#</i> .		Keys: <i>A</i> , <i>a</i> .

\*1) All of these examples in enh. modulation must be studied at the piano.

\*2) These 4 chords correspond exactly, *in sound*, to those in Ex. 173 (which see). The modulatory distinctions obtained by making each one a separate and independent *chord of the seventh* upon the separate tones of the original chord, are apparent in the different *resolutions*. While all 4 chords of Ex. 173 resolve alike into the I of *c* minor, they each resolve, here, into a different key, according to their notation. The enh. changes are found by comparing the chords with each other.

334. It is evident, then, that wherever the dim. seventh occurs, in any of the above 8 keys (in the notation corresponding to its key), it may enharmonically change its notation to that of any other of the 8 keys, and so effect an *enharm. modulation*. For illustration:

Ex. 249.

1. *c*-*a*      2. *f#*-*A*      3. *Eb*-*C*      4. *Gb*-*eb*

(At the piano) \*1) etc. \*2) etc. \*3) etc. \*4) etc.

$c I \overset{\circ}{V}_0 a \overset{\circ}{V}_0 I$      $f\# I \overset{\circ}{V}_0 A \overset{\circ}{V}_0 I$      $E^b I \overset{\circ}{V}_0 C \overset{\circ}{V}_0 I$      $G^b I \overset{\circ}{V}_0 e^b \overset{\circ}{V}_0 I$

\*1) This is an exchange of No. 1 and No. 4 of Ex. 248. It is not usual to make the enharm. change thus within one beat. — \*2) The change from beat to beat is better, as the ear has more time to apprehend it. — \*3) The enharm. change is made from one part to another (sopr. to tenor). — \*4) The awkward bass-progression (*cb* to *dh*) is correct because it is chord-repetition *in sound*.

335. There are only *three* chords of the diminished seventh in music which differ in sound; for, as just seen, those which represent four of the 12 minor keys, though differing in notation, *sound* exactly alike; in other words, one chord of the dim. seventh answers (*in sound*, though not in notation) to eight different keys, and therefore three different chords of the dim. seventh cover all 24 keys.

There are, of course, 12 of these chords in different *notations*, and there would be 24 but for the fact that the notation is similar in minor and major. The *dominant seventh*, on the contrary, actually occurs in 12 different *sounds*, as well as notations, because in no two keys (excepting each opposite mode) is it exactly alike.

Besides the dim. seventh on the note *b*, treated in Ex. 248, there are two others, then, which lie respectively a half-step above and below the former. Their enharmonic ambiguity is determined in the same manner. Thus:

Ex. 250.

A. 1. 2. 3. 4a. 4b.

Leading-tone *a*♯      Ldt. *c*♯      Ldt. *e*      Ldt. *g* or *f* ×

Keys: *B, b.*      Keys: *D, d.*      Keys: *F, f.*      Keys: *A♭, g♯.*

B. 1a. 1b. 2. 3. 4.

*D♭, C♯, c♯.*      *E, e.*      *G, g.*      *B♭, b♭.*

336. When the keys are remote (and, in fact, in any case) the enh. chord should be *prolonged* as far as the rhythm will permit. The longer it is dwelt upon, the less perceptible will the change of key be. Comp. par. 312. For illustration:

Ex. 251.

I.      \*1)      \*2)      \*3)      \*4)      \*5)      \*6)      \*7)      \*8)

SCHUBERT      BEETHOVEN

*f*  $\overset{\circ}{V}_0$  — *E♭*  $\overset{\circ}{V}_0$       *f*  $\overset{\circ}{V}_0$  — *d*  $\overset{\circ}{V}_0$  — I

*v*  $\overset{\circ}{V}$  *compl.*

\*1) The enharm. chord lasts a whole measure. — \*2) These enharm. changes correspond to Ex. 248, No. 3b to No. 2. — \*3) Ex. 248, No. 1 to No. 3b. — \*4) The moment a dim. seventh becomes a *complete V<sup>o</sup>* (by the addition of the *root*) its identity is fixed, and it ceases to be enharmonic. — \*5) The enharm. chord extends through 6 measures. — \*6) Ex. 250A, No. 3 into No. 2. — \*7) The effect of this change can be properly understood only by *first striking the tonic chord of c minor*. — \*8) First strike the I of *f* minor.

EXERCISE FIFTY-ONE.

\*r) The student may be at a loss to understand why, in several of the above changes of key, the modulation is not made *chromatically*, instead of *enharmonically*, since the former process is simpler than the latter. It will be observed that each dim. seventh (before its enharm. change) is introduced in its *legitimate* capacity as *incompl. dom.-9th* of the foregoing key, and this is the only *really correct* way. If, as at \*2), the dim. seventh does not belong to the foregoing key, then, of course, the chromatic introduction is unavoidable. It is the common practice, however, even among classic composers, to ignore the confusing enharm. change, and progress, chromatically, directly into that form of the dim. seventh which is valid for the desired key. Thus, in Ex. 249-1, no composer would write the *ab* and *g#* together on one beat, but would use *g#* alone. Similarly, in Ex. 249-2, the *e#* on the 3rd beat would commonly be written *f#* at once, as chromatic-alteration of the preceding *f#*. The enharm. change in some of these examples only serves to exhibit the *actual* nature of the modulation; in other examples, however, where the actual nature is most conspicuous (as in Ex. 251), the enharm. change is obligatory.

Add Original phrases.

OTHER RESOLUTIONS OF THE CHORD OF THE DIM. SEVENTH.

337. The modulatory utility of the chord of the dim. seventh is by no means exhausted in the above connections, because this most ambiguous and flexible of all chords is *not limited to its original signification as incomplete dom.-ninth, and to its original location upon the leading-tone*. These are its *legitimate* signification and location; but, as *altered chord, it occurs in several other locations, in both the major and minor modes*. These may be found by reference to the tables of altered chords, and are as follows:

- a. In Ex. 199c, a dim. seventh is found, as *altered  $\overset{7}{II}$  of the major mode*, with raised 2nd and 4th steps. Its characteristic features are, that it contains the **tonic note** of its key, and *resolves into the I*.
- b. In Ex. 200c, a dim. seventh appears, as *altered  $\overset{7}{VI}$  of the major mode*, with raised 1st and 6th steps. It contains the **dominant note** of its key, and *resolves into the  $\overset{7}{V}$* .
- c. In Ex. 204a, a dim. seventh is found, as *altered  $\overset{7}{IV}$  of the minor mode*, with raised 4th and 6th steps. It contains the **tonic note** of its key, and *resolves into the I*.
- d. To these should be added, in order to complete the table, the two *original* locations of the dim. seventh, as they are given in the foregoing examples. They are found, originally, in Ex. 173 (the legitimate  $\overset{7}{oV}$  of **minor**), and in Ex. 197 (the altered  $\overset{7}{oV}$  of **major**, with lowered 6th step). They both contain the **leading-tone** of their key, and *resolve into the I* (or first into the V and then the I).

Applied to the ch. of the dim. seventh upon *d*# (for example) the results, without enharmonic changes, are as follows:

Ex. 252.

1. As  $\overset{9}{V}_o$  of minor  
 2. As  $\overset{9}{V}_o$  of major  
 3. As II of major  
 4. As VI of major  
 5. As IV of minor

\*1) *F* major, according to 337*b*; but *f* minor may also be taken, in consequence of the  $\overset{7}{V}$ , which resolves into both modes.

338. The principles of enh. transformation explained in par. 333 (which review) apply, self-evidently, to the ch. of the dim. seventh in *all* of its possible significations. Therefore, the chord at Ex. 252, No. 3 will be found not only as II in *C* major (whose tonic note it contains) but as  $II^7$  in all the four major keys of which its four tones are the tonics, namely, *C*, *A*, *F*# (or *G*b), and *D*# (or rather, *E*b). Similarly, Ex. 252, No. 4 will be found as VI in all the four major keys of which its tones are the dominants (337*b*). And Ex. 252, No. 5 belongs as IV to the four minor keys whose tonics it embraces (337*c*). In each of these four keys the dim. seventh has a *different notation*; i.e., is enharmonically changed, of course; but it retains the *same chord-name* throughout.

339. Summing up these possibilities, it appears, then, that any one single chord of the dom. seventh will occur, in some notation or other,

- in the 4 minor keys (as  $\overset{9}{V}_o$ )
- and 4 major keys (as  $\overset{9b}{V}_o$ ) } of which it contains the *leading-tones*;
- in the 4 minor keys (as IV)
- and 4 major keys (as  $II^7$ ) } of which it contains the *tonics*;
- and in the 4 major keys (as VI) of which it contains the *dominants*.

In this manner it is easy to determine the keys to which the chord will belong, and the notation then simply agrees with the key (and chord) in question. The resolution of each chord is also very simple: excepting the altered  $VI^7$ , they all progress *directly into their I*. See par. 337*a-d*.

The following table exhibits the notations of the dim. seventh on *b*# (or *c*b) in the above 20 keys.

Ex. 253.

- As  $\overset{9}{V}_o$  of *c*# — e — g and *b*b } with the *leading-tone*: res. into the I.
- "  $\overset{9b}{V}_o$  of *C*# — E — G — Bb } with the *leading-tone*: res. into the I.
- "  $IV^7$  of *f*# — a — c — eb } with the *tonic*: res. into the I.
- "  $II^7$  of *A* — C — E<sub>b</sub> — G<sub>b</sub> } with the *tonic*: res. into the I.
- "  $VI^7$  of *D* — F — A<sub>b</sub> — C<sub>b</sub> (B) } with the *dominant*: res. into the  $\overset{7}{V}$ .

There are only four, of all the 24 keys, which are not represented by this dim. seventh, namely, *d*, *f*, *g*# and *b* (those minor keys whose dominants occur in the chord), and even these are ultimately obtainable. See Ex. 252, Note \*1). All the major keys are represented, not only by this chord, but by each of the three dim. sevenths. It has been seen that each

major key contains all three of these chords, thus:

$\overset{9b}{V}_o$   $II^7$   $VI^7$

which accounts for each single one occurring in all the major keys (in four different notations).

340. From this it is manifest that *any* chord of the dim. seventh may serve as a modulatory medium between any of the 12 major and 8 minor (*i.e.*, 20) keys in which it occurs. That is to say, the dim. seventh in Ex. 253 can be introduced (probably from a tonic chord) in *any* of the 20 given keys and then changed and resolved into *any other* of the 20. In modulating along any of the 4 vertical rows of keys, no enharmonic change is necessary; but in modulating from any row into another row (to the right or left, in this table), the notation must be altered. For illustration:

Ex. 254.

1. *Allegro* BEETHOVEN MENDELSSOHN  
 \*5) \*1) \*2)  
 D  $7^{##}$  VI  $7$  V  $e$   $\overset{\circ}{V}_0$ .  $7^{##}$   $9b$  F IIC  $\overset{\circ}{V}_0$  I

3. *Moderato* WAGNER 4. *Allegretto* SCHUBERT  
 \*5) \*3)  
 Ab  $7^{##}$   $\overset{\circ}{V}_0$  C II  $I_2$  c IV  $\overset{\circ}{V}_0$  F II  $I_2$

5. *Allegro* MENDELSSOHN  
 \*5) \*4) *simile*  
 E  $\overset{\circ}{V}_0$  E  $\overset{\circ}{V}_0$   $7^{##}$  f# IV  $I_2$

\*1) By changing the  $b\sharp$  (of the first measure) into  $c\sharp$ , the chord loses its *D* major signification and is turned into *e* minor. — \*2) Par. 337a. — \*3) The same chords as at \*2), but in reversed order. — \*4) The same chords as at \*1), but in different keys. — \*5) Strike first the tonic triad of the key.

341. The ready application of this complicated cluster of modulatory resources demands a *thorough* acquaintance with the different *notations* and *names* of the chords of the dim. seventh, and with the introduction and resolution of each, according to the key it is in.

It may be remarked, that there are two different ways of studying the modulatory facilities of the ch. of the dim. seventh: 1st, at the *table*, with strict regard to the *notation* and actual harm. signification of the chord; and 2nd, at the *piano*, without regard to the notation, but simply defining the location and progression of the chord according to par. 339. The latter is the more *practical*; and, if preceded by a thorough solution of Exercise 52A and B, is almost more recommendable than the former.

b. Certain mixed chords:

$C \left. \begin{array}{l} 7\#b \\ c \end{array} \right\} II \text{ (Ex. 215a)}$ 
   or   $F\# \left. \begin{array}{l} 7\# \\ f\# \end{array} \right\} II$

343. But the most common of these comparatively inferior enharm. changes is effected with the ch. of the **dominant-seventh**, which is similar in sound to a mixed Second-class chord of the major and minor keys whose tonics correspond to the leading-tone of the original key. In other words, the dom.-7th will resolve not only into its own tonic, but into the tonic a half-step below, — the  $\overset{7}{V}$  of C into the I of B, either mode; or the  $\overset{7}{V}$  of F into the I of E; etc. Thus:

Ex. 255.

$C \left. \begin{array}{l} 7 \\ c \end{array} \right\} V$ 
   and   $B\# \left. \begin{array}{l} 7x\# \\ b \end{array} \right\} IV$ 
   Resolution   $B \ I_2$ 
    $C \ I_2$

\*1) Ex. 218, chord No. 4. — \*2) Ex. 215, chord No. 6. Compare this treatment of the  $\overset{7}{V}$  with par. 324b.

344. The enh. modulations with this chord, which are very common, can be made equally well in either direction, between any two of the four keys represented. For example:

Ex. 256.

1.  $C \left. \begin{array}{l} 7 \\ c \end{array} \right\} V = B\# \left. \begin{array}{l} 7x\# \\ b \end{array} \right\} IV = I_2$ 
   2.  $B\# \left. \begin{array}{l} 7x\# \\ b \end{array} \right\} IV = C \left. \begin{array}{l} 7 \\ c \end{array} \right\} V = I_2$ 
   3.  $A \left. \begin{array}{l} 7 \\ a \end{array} \right\} V = A\flat \left. \begin{array}{l} 7\flat \\ a\flat \end{array} \right\} IV = I_2$ 
   4.  $F\# \left. \begin{array}{l} 7\# \\ f\#\end{array} \right\} IV = G \left. \begin{array}{l} 7 \\ g \end{array} \right\} V = I$ 
   5.  $G \left. \begin{array}{l} 7 \\ g \end{array} \right\} V = A\flat \left. \begin{array}{l} 7\flat \\ a\flat \end{array} \right\} IV = I$

COMPOUND ENHARMONIC CHANGES.

345. The distinction between simple and compound enharm. progressions is explained in pars. 331, 332 (which review). *Compound* changes are the most intelligible, because the diatonic or chrom. progressions which in that case accompany the enharm. change, assist the ear in following the modulation. This is impossible in *simple* enharm. chord-progressions, because there is no change in *sound*, and hence the intention of modulating is not perceptible until it has actually taken place. The following example contains only a few illustrations of the almost endless variety of compound enharm. chord-progressions:

Ex. 257.

\*1) \*2) or min. \*3)

D I G bI<sub>2</sub> F# Eb E V Eb eb A F A Ab

*Adagio*

\*4) \*5) \*6) Cad. \*7)

Between major and minor keys the relation is close; between *major* keys it is remote. For example:

Next-related                      Remotely related  
med.—tonic    tonic—med.    tonic—med.    med.—tonic

Ex. 258. and reversed

a C    a F    C Ab    C E

348. As both the tonic and the mediant belong to tonic chords, it is necessary to close the first key on its I (very rarely on the VI), and progress directly into the I (IV, or II) of the next key. The connecting tone usually remains in the same part.

I. tonic—med.    med.—tonic    tonic—med.                      med.—tonic

I                      A IV                      Bb I                      Bb VI                      D I

I Db = C#                      A IV

These pivotal modulations, though possible at any point in a phrase, like No. 3, above, are much more likely to occur at cadences or "joints." This is illustrated in Ex. 235-1; the tonic *b*, at the cadence, becomes the mediant of *G*. Also Ex. 235-2, tonic *a* becomes mediant *a*. Ex. 236-5 may also be explained as pivotal mediant modulations, in the course of a phrase: the mediant *g* in *E* becomes tonic in *g* minor; the mediant of *g* minor becomes the tonic of *B*; the mediant of the latter becomes the tonic of *d*.

349. Other significant coincidences are:

- a. The *dominant* transformed into a *mediant*;
- b. The *tonic* transformed into a *leading-tone*;
- c. The *dominant* transformed into a *leading-tone*.

CHOPIN, op. 61

dom.—med.    med.—dom.    tonic—ldg.-tone    dom.—ldg.-tone    *Adagio*    dom.—med.    and

Ex. 260.

C    Eb    C    A    C    Db    C    Ab    eb    Gb    Db    Fb(E)

These are illustrated in Ex. 235-4; the mediant *a*, at the cadence, becomes the dominant of *d* minor. Also Ex. 235-5; the dominant *c* becomes the mediant of *Ab* major. In Ex. 235-3, the tonic becomes a leading-tone, — see Note \*3); also Ex. 235-6, the same. Ex. 257, Note \*2).

**350.** While the connecting tones above mentioned are possibly more common than others, it is true in the most comprehensive sense that *any tone, in any harmonic significance, may become, as pivot, a transitional medium between the keys to which it respectively belongs.*

For instance, the tone *C* may be either one of the seven original scale-steps, in seven major and minor keys, — namely, in *C, c, Bb, bb, Ab, a, G, g, F, f, Eb, e, Db, db* (or, as *B#*, in *c#* minor). Besides these, it may be the lowered 6th scale-step (in *E* major), the lowered 7th step (in *d, D*), the lowered 2nd step (in *b* minor); as *B#*, it may be the raised tonic (in *B* major), the raised 2nd step (in *A*), the raised 4th step (in *F#* and *f#*), the raised 5th step (in *E*), the raised 6th step (in *D*, and *d#* minor). This one tone *C* (or *B#*) may, then, be used as modulatory medium between *any* of these 26 keys, in either direction. And the same applies, of course, to *every* tone in music.

**351.** There is only one important limitation to this sweeping principle, and that is that it is far more natural to transform an *inactive tone into an active one*, than the reverse; best to change a tone as tonic, 3rd or 5th step, into a 4th, 6th, 7th step, or any other active tone. Hence, par. 349*b* and *c* are very common, but the reverse very rare. For example:

Ex. 261.

step 1 2# 5 6 8 6 4 7 2 6#

C A F Eb a e G Db Bb E

6. *Allegro* Jos. SUK

$b$   $\overset{7}{V}$ I —————  $g$  I —————  $b$   $\overset{7}{V}$  ————— etc.

\*1) The 5th step,  $g$ , becomes a 6th step of  $b$  minor; an *inactive* tone transformed into an *active* one. Par. 351. — \*2) The pivotal tone  $d$  is the 3rd step, becoming a 4th step. — \*3) The common tones are  $f\sharp$  and  $e\flat = d\sharp$ . — \*4) From “*La plus que lente*,” given here slightly simplified. — \*5) The notes marked  $x$  are embellishments. — \*6) The pivotal tone is  $g\flat = f\sharp$ , — 1st step, then 6th, then 7th step. — \*7) The lowered 7th step. — \*8) The common tone is  $b\flat$ , through-out; first as inactive tonic of  $b$ , then as active leading-tone of  $C$ . Observe that the second measure is all chord-repetition; also the change of mode from major to minor and back. — \*9) This 5th step ( $f\sharp$ ) becomes a leading-tone. — \*10) The unusual substitution of  $g$  minor (for the expected major) is due to the coincidence of  $b\flat$  and  $a\sharp$ , — a mediant becoming a leading-tone (at the beginning of the next measure).

These illustrations might be multiplied indefinitely. It is left to the student, who, if he will *observe* what he sees in the literature he uses, can be at no loss for confirmation of this principle, — and all the others, — of modulation.

B. A large number of brief **Original** phrases.

SECTION 5. THE HARMONIZING OF MELODIES, WITH MODULATIONS.

352. a. Harmonizing a melody with modulations is, as far as each separate key extends, precisely the same process as before. Review Ex. 178.

b. The only new thing that presents itself here, is to determine *what changes of key are necessary, and where the changes take place.* From the point where a key begins, until it is exchanged for another, the melody-notes are harmonized in the usual manner, according to the scale-steps of that key.

353. The changes of key, or the points where modulations are to occur in the harmony, may be defined:

1st, by *accidentals in the melody itself;*

2nd, by the *general construction of the melody,* which affords more or less distinct evidence of intentional modulations; and

3rd, by *option,* at any point in the phrase where the melody will admit of a change of key.

1ST. MELODIES WITH INDICATED MODULATIONS.

354. *Accidentals* in the course of a melody indicate either altered chords, or changes of key.

(The former may be set aside for the present.)

This is exhibited in the following example, in which the keys are indicated below the notes at the points where they begin:

Ex. 263.

\*1) \*2) \*3) \*2)

G — a — G — e — D — b — G

\*1) *a* minor, — not major. The keys should maintain *near* relationship, as much as possible. — \*2) These apparently superfluous accidentals are necessary, as contradiction of the preceding key. — \*3) *D* major, not minor.

Applying the fundamental rule of modulation (par. 302, pars. 298, 300) to this melody, the result is:

G — a — G — e — D — b — G

Ex. 264.

G VI a V IG V I e V<sub>0</sub> I D V I b V<sub>0</sub> IG V

**355.** *a.* In the above example, the accidentals proved to be the *leading-tones* of the required keys, with the single exception of *c♯* in the 6th measure, which merely served to indicate that the preceding key had been *cancelled*. Such "negative" modulations as the latter generally leave a choice between the *two relative keys*. For instance, the *c♯* in the above example indicates that the *two-sharp* key (*b* minor) has been reduced to a *one-sharp* key; but there is nothing in the *c♯*, nor in the tones which immediately follow, to define *which* of the one-sharp keys (*G* or *e*) is intended. Consequently, either *G* maj. or *e* min. may be taken. Thus:

*b.* This choice between the two *relative* keys (those with the same signature) is possible at other points also, and usually depends only upon the succeeding melody-notes. For example, the *f♯* in the 2nd measure of Ex. 264 might also be regarded as an indication of *e* minor; but the two slurred notes which follow (*g-d*) prove that *G* major is intended. The same applies to *c♯* in the 4th measure, which might also be *b* minor, but for the following *d-a*. Compare par. 242, rule 1. — This point is illustrated in the following melody:

\*1) *a* minor is not possible, on account of the next measure. — \*2) *d* minor is possible, because of the *c♯* which is slurred with the *bb*. — \*3) Must be *C* major, on account of the cadence. — For these reasons it is best to take *d* minor at \*4), and *a* minor at \*5); at \*6) *G* major, because of the two preceding *minor* keys. Thus:

## 2ND. MELODIES WITH INTIMATED MODULATIONS.

**356.** There are certain features in the *construction* of a melody which afford almost, if not quite, as unmistakable signs of a necessary change of key, as accidentals do. The strongest intimations of this kind are found,

1st, at the *cadences*; and

2nd, in the arrangement and treatment of certain scale-steps, — especially the *leading-tone*.

In the first of the following melodies there are no accidentals to indicate positively that the original key (*C*) is anywhere abandoned. But it is nevertheless *probable* that the semi-cadence is made in *G*, and *certain* that the perfect cadence is in *a* minor.

And it is also certain that the 3rd measure does not continue in *G* major, because the arrangement of tones does not conform to that key; especially the *f♯* (3rd beat) which indicates either a return to the original key (*C*), or the point of transition into the ultimate *a* minor.

Ex. 268. *a.* *semi-cad.*

C ————— G (C) ————— a

Ex. 265 also illustrates this principle: the modulation from *e* minor back to *G* major is only intimated by the cadence note. If the last note were *e* instead of *g*, as it might easily be, it would continue *e* minor to the end.

In the following melody:

*b.*

C ————— a ————— C

the key of *C* maj. evidently ceases at the end of the first measure, because the *b* in the next measure *cannot be the leading-tone of C, and progress as it does, downward to e*. It is therefore obvious that *a* minor (indicated by *g*♯) extends back to this *b*. — The final cadence must be made in *C*, of course.

How far "back" such intimated modulations reach, or, in other words, at exactly what beat the new key will begin, depends upon circumstances, and will generally be determined by experiment. Comp. par. 242, rule 4.

The above melodies will then be harmonized about as follows:

C — G — C — a — C — a — C

G I<sub>2</sub> C IV a II a II<sub>1</sub> V C II I<sub>2</sub> V

EXERCISE FIFTY-FIVE.

Melodies with indicated and intimated modulations.

*a.* *\*1)*

*b.* *\*2)* *\*1)*

*c.* *\*3)* *\*4)* *\*1)* *d.* *\*5)*

*e.* *\*6)* *\*7)*

\*1) Ex. 146, Note \*2). — \*2) *d* min. follows *e* min. directly, despite the lack of relation, because of the sequence. Comp. Ex. 263, Note \*1). — \*3) *E♭* or *c*; the former is better, for variety. — \*4) *A♭* or *f*. — \*5) *g* min. begins at this (2nd) beat, because *a* cannot, in this case, be harmonized as leading-tone. — \*6) Here the I of *D* major should be used, as V of *g* minor. — \*7) II<sub>1</sub> of *B♭*. — \*8) *G* or *e*. — \*9) I of *A♭*, as V of *D♭*. — \*10) Lowered 6th step. — \*11) Evident from the following slur, that this is the raised 2nd step of *E*. — \*12) *E* or *c♯*. — \*13) Probably *f♯*, on account of the following slur. — \*14) *C* major. — \*15) *a* minor begins on this beat, — bass note *d*. — \*16) Best to use *A* major here, as V of the coming *d*.

3RD. MELODIES WITH OPTIONAL MODULATIONS.

357. The possibility of modulating, in the harmony to a given melody, is by no means limited to those points at which the *melody itself* demands a change of key. *Transient* modulations may be made at almost any accent, and even upon some unaccented beats, by simply intensifying the triads, at those places, into the keys which they respectively represent.

358. The rule for these optional modulations is as follows: *Every major or minor triad \*1) which occupies an accented beat, may become a tonic triad* (of the corresponding key, of course), *provided the preceding melody-note can be harmonized with any dominant chord of that key.*

\*1) This modulatory principle is limited to major and minor triads, these being the only chords which represent major and minor keys. Four-tone chords, and discords, do not represent keys.

The triads are first defined according to the scale-steps of the *original* key, upon the usual assumption that each melody-note may be a *root*, a *third*, or a *fifth* of some chord of the key. This ensures the necessary next-relationship, and decides which keys are represented. For illustration:

Ex. 270. C major

\*1) The *first* and *last* accents must, of course, be excepted. — \*2) This melody-note *c* (the 1st step of the scale) may, according to former rules, be harmonized with the I, VI or IV and inversions: in other words, *it may be a root, a third, or a fifth*. — \*3) Here, only two triads are available, those on *d* and *f*. The triad on *b♭*, being a diminished chord, does not represent any key.

359. *a.* These major and minor *triads* of the original key may, as stated in par. 358, be regarded as representatives of their corresponding maj. and min. *keys*, upon the conditions mentioned. Thus:

Ex. 271.

\*1) The triads I, VI and IV of the original key (*C* major) are the tonic triads of *C* major, *a* minor and *F* major respectively. And the keys at the other accents are found in the same way.

*b.* In order to intensify these simple “chords” into the complete impression of “keys,” they must be associated with the respective leading-tones, or, more exactly, must be **preceded** by the necessary modulatory (*dominant*) chord. *If the preceding melody-tone will admit of this*, the key in question is possible; otherwise not.

Applying this test to the above melody, the result will be:

Ex. 272.

\*1) *e* minor is not possible, because it has no *f♯*. And *a* minor is a little doubtful on account of the *g♯* which follows; from which it appears that, as usual, some consideration must be taken of the *following* tone, also. — \*2) In *d* minor, the *g* in soprano would be an *ascending* seventh (of the *V*), and is therefore doubtful. But see par. 218*a*. — *a* minor is impossible, as it has no *g♯*. — \*3) *e* minor is doubtful, because of the *d♯* in the next measure.

*c.* This melody may be harmonized, then, 1st, in *C* major throughout; or, 2nd, any one of the above keys may be introduced as *single* passing modulation; or, 3rd, *several* or *all* of them may be utilized, in a great variety of successions. The following modulatory lines are possible: 1. *C* major throughout. 2. *C-C-G-C-C-F-C*; 3. *C-a-e-d-C-C-G-C*; 4. *C-a-G-F-a-C*; 5. *C-F-C-d-a-C-G-C*; 6. *C-F-G-C-C-F-G-C*; and so forth. For example, No. 3:

Ex. 273.

360. Melodies in triple rhythm often admit of such optional modulations at *unaccented* beats also. The following period, which may be harmonized in *e* minor throughout (as there are no positive contradictions of the original key anywhere in its course), evinces a strong inclination towards *D* major at the semi-cadence, and admits of other passing modulations, as follows:

Ex. 274.

e — G — a — e — D — e — a — e — (a-) e —

\*1) The indications of *a minor* are so strong through this whole measure (the first two tones representing its V, and the last tone its I), that the unaccented (3rd) beat suffices for the mod. — \*2) The slurred 2nd beat suggests *G major*, although *unaccented*. — \*3) Could not very well be the relative, *b minor*. — \*4) There are the same indications of *a minor* here, as at Note \*1); but there is hardly time to make the mod., except by taking the *E major* I on the first beat (as V of a minor). The result is:

Ex. 275.

G V a V G V D I<sub>2</sub> e V<sub>0</sub> C V E V<sub>0</sub> a V e I<sub>2</sub>

\*1) Ex. 274, Note \*4). The only difference between *E major* and *minor* is the *g#* in bass, which is preferable to *g#*, on account of the following *a minor*. Compare par. 313. — \*2) This melody may, of course, as already stated, also be harmonized in *e minor* throughout, without the optional passing modulations.

EXERCISE FIFTY-SIX.

A. Harmonize Ex. 272 (perhaps at the piano, — the *bass alone* in the left hand) in the 6 ways shown in par. 359c (excepting No. 3, which is given in Ex. 273). — And also Ex. 274, first in *e minor* throughout, and afterwards with *G major* in the 5th measure and *a minor* in the 6th measure.

B. Harmonize the following melodies; each in *at least two ways*.

a. \*1) \*2) \*3) \*4) \*5) b.

\*6) \*7) \*7) \*8) c. \*8) \*9) \*10) \*11) \*12)

d. \*13) \*14) \*15) e.

\*16) \*17) \*18) f.

\*1) *f*♯ minor. — \*2) *A* maj. — \*3) *D* or *b*. — \*4) *E* major, — not *c*♯. — \*5) *A* maj. probably begins at this beat (as I), because *E* ends on the preceding beat. It might, also, be the *V* of *b*, in view of the following tones. — \*6) *B*♭ or *g*. — \*7) *C* or *a* at each of these accents; probably *C* first. — \*8) *A*♭ or *f*. — \*9) *D*♭ or *bb*. — \*10) *E*♭, — not *c*. — \*11) *f* minor, — not *A*♭. — \*12) Not *D*♭, unless the following slur is ignored, — which is possible. — \*13) See Ex. 144. — \*14) *F* major. — \*15) Might be *F* major. — \*16) *D* maj. *I*<sub>2</sub>. — \*17) From this point the melodies also contain indicated modulations. — \*18) The following slur (*b* and *d*) is so suggestive of *G* major, that this *a*♯ might easily be a raised 2nd step of *G*. But *b* minor is also possible. — \*19) These slurred notes must be the *I*<sub>2</sub> of *F*♯, therefore the preceding *b*♯ is a raised 4th step. — \*20) This *a*♯ may be a raised 4th step. — \*21) A strong intimation of *a* minor.

---

C. To this exercise may be added some, or all, of the preceding exercises in melody harmonization. See the final Note to Exercise 36.

---

## PART IV.

### THE INHARMONIC (NON-HARMONIC) INTERVALS.

**361.** *a.* When 3, 4 or 5 tones are combined in thirds, they mutually accord, and constitute a harmonic body which affects the ear agreeably. Such tone-combinations are called *chords*, and the separate tones are *harmonic* intervals, or *chord-intervals*.

*b.* A body of tones, united in intervals which do not conform to this rule for the construction of chords, is called an **inharmonic** combination, and the tone or tones which disagree with the structure of thirds are **Inharmonic** intervals. Par. 46c.

*c.* The inharmonic tones are those *which lie between, or beside, the chord-intervals*, and, consequently, do not belong to the chord. For illustration, in the I of C major the tones *c-e-g* are harmonic, but all the other (intermediate) tones, diatonic and chromatic, are inharmonic, *in connection with that chord*. Thus:

Ex. 276. A musical staff in treble clef showing a scale of C major: C, D, E, F, G, A, B, C. Above the staff, intervals are marked as 'Har.' or 'inh.' with lines connecting the notes. Below the staff, notes are marked with asterisks: \*1) under D and E, and \*1) under B. The notes D and E are marked as inharmonic, while C, F, G, A, and B are marked as harmonic.

\*1) *B* $\flat$  might be a seventh, and *d* $\flat$  or *d* $\sharp$  a ninth of this chord, as *dominant chord* of *F* maj. or minor. But they are inharmonic in the chord as *I* of *C* major.

**362.** It is evident that the quality "inharmonic" is merely relative, and depends upon the ruling chord. Therefore, before it can be decided whether a tone is inharmonic or not, the identity of the chord in connection with which it appears, must be established. This may be done by the accompanying parts, or it may be obviously deduced from the *connections with the preceding and (chiefly) with the following chords*. Thus (the inharmonic notes are marked o):

Ex. 277. A musical staff in treble clef showing a sequence of chords: C I, IV<sub>1</sub>, I<sub>2</sub>, I, V<sup>7</sup>, I, I, IV<sub>1</sub>, I<sub>1</sub>. Below the staff, bass notes are marked with asterisks: \*1) under C, \*2) under F, \*3) under C, \*4) under F, and \*5) under C. The notes marked with asterisks are marked with circles (o) in the original image, indicating they are inharmonic. The bass notes are: C, F, C, F, C, F, C, F, C.

\*1) The duration of the tones in the bass clef, compared with the brevity of the upper tones, sufficiently defines both the harmonic and inharmonic notes. — \*2) The peculiar bass figuring,  $\frac{7}{4}$ , shows that the tones are combined in a non-harmonic way. Whether the  $\frac{7}{4}$  is a distortion of  $\frac{9}{4}$ , or  $\frac{7}{3}$  or  $\frac{9}{8}$ , depends chiefly upon the chord which *follows*. At \*2) it is evidently the *I*<sub>2</sub> of *C*; at \*3), the *V*<sup>7</sup>; and at \*4), the *IV*<sub>1</sub>. — \*5) The *d* in soprano cannot be a "ninth," because there is no seventh with it.

**363.** Inharmonic tones are of the utmost importance and value in music, as they constitute practically the entire *embellishing equipment* of the composer. They animate the simple chords, add melodic significance to the several parts, and are an almost unlimited resource of ingenuity and effectiveness. The manner and extent of their use is so decidedly individual, that the distinctive style of every great writer is characterized chiefly by his treatment of the inharmonic embellishments.

364. As stated above, every inharmonic tone is, strictly speaking, a neighboring-note. But it is customary to speak of four kinds of inharmonic tones: the **organ-point**, the **suspension**, the **anticipation**, and the **passing-note** or **neighboring-note**, which are distinguished according to the manner in which they enter and progress. They may also be divided into three groups, as follows: the organ-point is a *heavy* (long) embellishment, the neighboring-note a *light* (short) embellishment, and the suspension and anticipation result from partial *mixture* of a chord with those which precede or follow it.

### SECTION I. THE ORGAN-POINT.

365. a. The organ-point (also called "pedal-point") consists in *sustaining a certain scale-tone* during a section of the phrase or period (or throughout), almost or quite *irrespective of the harmonic progressions in the other parts*.

As the latter progress from one chord to another, and perhaps even modulate into other keys, the sustained note must necessarily disagree from time to time with their harmonies, and become *inharmonic*.

b. The organ-point differs materially from the other inharmonic elements, and constitutes therefore a distinct phase of "inharmonics" by itself. As a general principle, inharmonic notes demand resolution more urgently than sevenths, ninths and other active tones, which, though dissonances, are at least *harmonic*. The organ-point, on the contrary, is a *heavy, impassive* tone, which effects its "resolution" by simply *remaining* until the other intervals return to mutual consonance.

366. On account of its weight, the organ-point must be a tone of such quality as will endure prolongation without endangering the harmony, namely: as a rule, *either the tonic or the dominant note of the principal key*.

The prolongation of the tonic or dominant notes as organ-points is justifiable on the grounds that these are naturally the dominating tones of the key, and whether they are merely retained in the mind, as ideal prolongation of those factors from which all the relations of the key must be determined, or are *actually held* and kept sounding in the ear, is not a matter of great difference.

The following is an example of the tonic organ-point in bass:

Ex. 278. \*1)

*Legato*

C maj. \*2) \* \* \* \* \* (\*) \*

\*5) Tonic org.-pt.

\*1) This, and the following examples, are *continuous*, — not *single* measures. — \*2) These asterisks indicate the points at which the sustained tonic in bass is *inharmonic*. — \*3) Throughout this meas. the *c* in bass might be regarded as a harmonic seventh of the chord; but it does not impart that impression. — \*4) Here, also, the *c* in bass *appears* to be harmonic (fifth of the chord); but its identity as organ-point is already fully established. — \*5) The student will obtain a correct impression of the organ-point, at the piano, only by striking, — not holding, — the tone at each beat.

The following is an example of the dominant organ-point in bass:

*Andante* WAGNER

Ex. 279.

F# maj.—min.

Dom. org.-pt.

#### HINTS AND DIRECTIONS.

**367.** The organ-point possibly owes its origin to the “organ,” upon which it is easily produced by simply holding the corresponding bass-pedal, while the hands continue the harmonic progression on the manuals. Hence the terms “organ-point” or “pedal-point.” It is, however, obviously not limited to this, or any other, instrument. The following details must be borne in mind:

*a.* Being a tone that enriches rather than embellishes the harmony, that aids in holding the chords firmly together, it is essentially fundamental in character and therefore appears most appropriate *in the bass*, — *i.e.*, *below* the other parts. It may, however, appear in an inner part, especially as duplication of the bass organ-point, and is even possible in soprano, though very rare. In the latter case it is sometimes called an *inverted organ-point*.

*b.* The organ-point should, as a very general rule, *begin and end as harmonic tone* (*i.e.*, as legitimate chord-interval).

*c.* As stated in par. 365*a*, the organ-point is sustained irrespective of the chords in the other parts, but there is naturally a limit to this rule. If the sustained tone becomes harshly discordant for several successive beats, or if the modulations extend into remote keys, the result is disagreeable. This limit will be most easily determined by the *ear*. There is least objection when the *other parts move smoothly*; when the harmonies are simple; and when care is taken to make the organ-point *harmonic* from time to time. Still, it is a prerogative of the organ-point to conflict sometimes almost fiercely with the other parts, and its persistency seems to be a sufficient justification.

The following example, however, is palpably doubtful. (Comp. par. 426.)

Ex. 280.

etc.

*d.* The length of organ-points is optional; sometimes they extend through a whole piece, or through large sections; and sometimes, on the contrary, they are quite short. The difference between ordinary (long) organ-points and short ones is very great, and will be considered later. *Long organ-points* should, according to the law of rhythm, commence on an *accented* beat.

e. The organ-point may be *held*, or it may be reiterated, — perhaps in alternation with the upper or lower octave, or with the interposition of another harmonic interval. This will depend largely upon the instrument for which the composition is written, and upon the desired effect. See Ex. 282, and 285, No. 3.

f. It will be well to remember that the **tonic** note becomes an organ-point *in connection with dominant* (1st Class) chords: and the **dominant** note *in connection with subdominant* (or 2nd Class) chords. And both become organ-points during *next-related modulations*. Thus:

Ex. 281.

\*11)

\*1) Dominant organ-point in bass. — \*2) Tonic organ-point in bass. — \*3) This is the manner in which the organ-point in No. 1 is reproduced later in the composition. — \*4) Tonic org.-pt. in bass, and *doubled in alto*. — \*5) The org.-pt. is transferred from bass to tenor. — \*6) The lowered 6th and 2nd steps in B♭; the *db* is a passing-note, and suggests *eb* minor. See par. 400c. — \*7) The tonic organ-point which occurs at first in bass, is transferred to the tenor by simply inverting the lower parts during the repetition of the phrase. — \*8) Doubled org.-pt. in bass and alto. — \*9) Doubled org.-pt. in soprano and tenor, and then in soprano and bass. — \*10) An unusual example of the org.-pt. in soprano. The harmony is a chromatic succession of 6ths (par. 326a). — \*11) An organ-point, especially when in bass, is often thus *interrupted* by the intermediate intervals of the broken chord. See Mendelssohn, Songs without Words, No. 12, first measures (*f*♯ in bass); No. 31, beginning of 2nd measure, and last 5 measures; No. 37, last 12 measures (*f* in bass). — \*12) *E* and *c*♯ are neighboring-notes. — See also the following general examples:

Beethoven, Sonata op. 28, first movement, measures 1-24, *d* in bass;  
 “ “ “ “ first movement, the last 24 measures, *d* in bass;  
 “ “ “ “ second movement, measures 9-15, *a* in bass;  
 “ “ “ “ last movement, measures 1-16, *d* in bass;

the same movement, measures 25-34 *from the end*, *a* in bass; and also the last 18 measures, *d* in bass. — Beethoven, Sonata op. 49, No. 1, the last 12 measures, *g* in bass. — Mendelssohn, Sonata op. 6, first movement, measures 18-26; last mov't, measures 44-25 *from the end*. — Mendelssohn, Overture “Meeresstille,” measures 20-36, *d* in soprano.

### THE PASTORAL ORGAN-POINT.

368. Sometimes the tonic and dominant notes are sustained *together*, as *double organ-point*, in the interval of a 5th (tonic *below* the dominant), and usually in the lowest parts.

This is called the “pastoral” org.-pt., probably because the upper parts are necessarily limited to such simple chords and modulations as can be associated with *both* sustained tones, without producing too harsh a dissonance.

For illustration:

Ex. 288.

1. *Grazioso* A maj. \*1)

2. *Moderato* D maj. \*1)

MENDELSSOHN 3. *Allo. mod.* etc. G maj. *idem.*

4. *Allegretto* GOUNOD etc. G maj.

5. *Allto.* SCHUBERT etc.

6. *Andante* BRAHMS D maj. \*2)

\*1) Tonic and dominant sustained together in the lower parts, as pastoral organ-point. — \*2) Here the pastoral organ-point is presented by *one part alone*, in alternating tones, and includes the upper octave of the tonic, also.

## EXERCISE FIFTY-SEVEN.

A. To a number of the phrases (both given basses and original exercises) written in Part II, add, as lowermost (fifth) part, a tonic organ-point. Also a dominant organ-point, extending from near the beginning up to the perfect cadence. For example, Exercise 10, bass *e*:

and

etc.

Tonic organ-point

Dominant organ-point

B. Write a large number of **Original phrases**, or periods, with tonic, dominant, and pastoral organ-points.

IRREGULAR ORGAN-POINTS.

369. While the tonic and dominant notes are unquestionably the best adapted to prolongation as organ-points, other steps of the scale can also occasionally be used in the same way. But such organ-points are irregular, rare, and difficult to handle.

370. The commonest and best of these is, probably,

THE MEDIANT ORGAN-POINT

obtained by sustaining the *3rd Scale-step*. This step is closely allied to the tonic and dominant (not only in its *harmonic* equality as part of the tonic triad, but more particularly in its similar quality as *inactive* tone), and its prolongation as organ-point seems therefore justifiable.

The mediant organ-point is more common in minor than in major; it is invariably in *bass*; is usually brief; and must be associated with very simple and smooth harmonic progressions. The following chords are the best:

Major or minor

Major

Minor

Ex. 284.

Ex. 285.

Mediant org-pt.

Med. org-pt. Med. org-pt.

3. *Moderato* \*1)

A min.

\*2) \*3) \*4) \*5) \*6) \*7)

SCHUMANN

\*1) This example is taken from Schumann's 3rd Symphony, 2nd movement, commencing at the 4th double-bar. It is a most remarkable and beautiful illustration of the mediant org.-pt. If the student wishes to obtain a more complete impression than is conveyed by the above condensed version, he may do so from a 4-hand arrangement. — \*2) The tone *c* in bass is at first the *mediant* of *a* minor. At \*3) it becomes the *dominant* in *F* maj.; at \*4) it is again a mediant; at \*5) it is a short dominant in *F*, and immediately afterwards is associated with *d* minor; at \*6) it is again the mediant; and at \*7) it yields and proceeds into the perf. cadence.

### 371. Other irregular organ-points will be found in the following works:

Subdominant org.-pt., see Schumann, op. 23 ("Nachtstücke"), No. 1, measure 24-21 from the end, *g* in bass. This, like the mediant org.-pt. of Schumann (cited above), does not remain a subdominant (of *d* minor) constantly, but changes to a dominant of *C* maj., then back to a subdom., and ends as tonic of *G* major. — Also Mendelssohn, Songs without Words, No. 27, measures 25 and 26, *u* in soprano, in *e* minor. — In the same piece, measures 27 and 28, there is a double-org.-pt., *e* in soprano as tonic, and *c* in bass as submediant of *e* minor. These are both justified by the simplicity and smoothness of the inner parts (successive diatonic chords of the 6th). — Mediant org.-pt., see Mendelssohn, Songs w. W., No. 25, measures 18-20 (commencing to count, as usual, at the first full measure), *c* in bass, in *a* minor; intercepted as in Ex. 282, Note \*11).

### THE SHORT ORGAN-POINT.

372. *a.* Short organ-points generally extend over three chords only (beginning and ending harmonic, and becoming inharmonic at the middle chord), and therefore hardly convey the impression of sustained tones. They are used chiefly for the purpose of avoiding unquiet or inconvenient progressions in the single parts. When any part quietly holds its tone, instead of joining in the harmonic succession of the other parts, the effect is rarely disagreeable, when brief.

*b.* A short organ-point may appear in any part; and it may be any step of the scale, — but will always be least hazardous if it is either the tonic or the dominant of the momentary key. It may also occur at any part of the measure.

The following illustrations are all taken from Mendelssohn's "Songs without Words."

Ex. 286.

The musical score consists of three systems of piano accompaniment. Each system has a treble and bass clef staff. The first system (I.) is in G major, 9/8 time, and contains three measures with organ-point markings \*1), \*2), and \*3). The second system (4. and 5.) is in G major, 9/8 time, and contains four measures with organ-point markings \*4), \*5), \*6), and \*7). The third system (6. *Adagio*) is in G major, 2/4 time, and contains three measures with organ-point markings \*8) and \*9). Below each system, chord progressions are written in Roman numerals with organ-point symbols (V, V<sub>0</sub>, V<sub>7</sub>, etc.).

I. 8 9/8 G I D V<sub>0</sub> G V<sub>7</sub> I 8 9/8 I D I II V<sub>7</sub> I 8 9/8 A II VI II I<sub>2</sub> V<sub>7</sub> VI V<sub>7</sub>

4. 8 9/8 G V<sub>7</sub> I V<sub>7</sub> I 8 9/8 G I V<sub>7</sub> V<sub>9</sub> I V<sub>7</sub> 8 9/8 A I V<sub>7</sub> I V<sub>7</sub> I D V<sub>7</sub> I V<sub>7</sub> I

5. 8 9/8 G I V<sub>7</sub> V<sub>9</sub> I V<sub>7</sub> 8 9/8 A I V<sub>7</sub> I V<sub>7</sub> I D V<sub>7</sub> I V<sub>7</sub> I

6. *Adagio* 4 2/4 A V<sub>7</sub> I VI V

\*1) Short dominant org.-pt. (*d*) in soprano and bass. The key and chords are marked below each example. — \*2) Dom. org.-pt. (*a*) in alto. — \*3) Subdom. org.-pt. (*d*) in bass. — \*4) Dom. org.-pt. (*e*) in bass. — \*5) Subdom. org.-pt. (*c*) in bass. — \*6) Leading-tone org.-pt. (*f*♯) in alto. The *f*♯ is held instead of resolving to *g*, the note which is necessary for the I. — \*7) Leading-tone org.-pt. (*g*♯) in alto. — \*8) Leading-tone org.-pt. (*c*♯) in tenor, transferred to alto. — \*9) Dom. org.-pt. (*e*) in tenor.

It will be observed that the chord-progressions, during which these short organ-points occur, are of the most regular and simple kind; chiefly I-V-I. And it may be added that the passive resolutions of harmonic discords (seventh and ninth) are analogous to the short organ-point.

FUNDAMENTAL PRINCIPLES.

All inharmonic tones lie either directly below or above the harmonic ones.

An organ-point is, usually, a sustained tonic or dominant note; and is most common in the lower-most part.

An organ-point begins and ends as *harmonic* tone.

Short organ-points are used chiefly to obviate inconvenient voice-progressions.

## EXERCISE FIFTY-EIGHT.

a.

b.

\*1) The figures below the bass notes merely indicate, as usual, *which upper tones* are required. It is left to the pupil to find where short organ-points occur, and locate them properly.

Add a number of **Original phrases**, or periods, applying all the principles explained in this Section, and introducing any kind of organ-point.

## SECTION 2. THE SUSPENSION.

**373.** The suspension is a tone which is held over from one chord into the next in such a manner that it becomes inharmonic with the second chord.

It is, strictly speaking, nothing more or less than a *neighboring-note* (see par. 364), but one that is "prepared" by some interval of the preceding chord. For the present it will be spoken of as suspension, but ultimately the term neighboring-note will invariably constitute a correct analysis.

**374.** Being a neighboring-note, its resolution is performed by a *diatonic movement*,—usually *downward*,—but sometimes upward, into the legitimate interval of the second chord which it displaces. Thus:

Ex. 287.

\*1) Again separate measures. — \*2) S. signifies "suspension." — \*3) The first measure is the given chord-progression. In the next measure, the soprano note *d* of the first chord, — which may become a suspension *because it moves step-wise*, thus assuring its quality as neighboring-note, — is held over into the second chord, where it becomes the *upper neighbor* of the harmonic tone *c*. During the second chord it makes its resolution by progressing to this *c*, which its prolongation had displaced, or "suspended." — In the third measure there is a suspension in alto, — *f*, the upper neighbor of *e*. — In the 4th measure there is a double suspension in soprano and alto; in the 5th, in soprano and bass, — the latter a *lower neighbor*, with upward resolution.

From the above it is obvious that the suspension does not alter the original *melodic* progression in the part or parts involved, but merely changes the *rhythmic* form. Instead of moving in uniform rhythm with the other parts, it limps after them (comp. Ex. 287, measures 1 and 2), and the perpendicular lines are thus bent into an *oblique form*.

HINTS AND DIRECTIONS.

375. a. Suspensions may occur in any part, but are perhaps most common in the *soprano*. They are also excellent in either inner part, but somewhat less so in bass.

b. The *length* of a suspension is optional; generally it is just *half the value* of the chord into which it extends. It may be *more*, but rarely *less* than this. Thus:

c. The suspension may be *tied* to its preparing-tone (as in Ex. 287), or it may be re-struck, as in Ex. 288, No. 3. The struck suspension is more emphatic and effective. In organ music it is usually tied.

d. It is apparent that the suspension must always appear *upon the first (accented) fraction of its beat*, — usually upon the accented beat. It may stand on the 2nd beat in triple measure, — Ex. 289a. The resolution is *always less accented*.

e. The suspension is subject to the general rule of neighboring-notes, that it should not appear *simultaneously with its resolving-tone* (in different parts, of course). But this depends wholly upon the quality of the principal tone involved; if a strong scale-step, the duplication is good; if the leading-tone, 3rd or 6th step, it had best be avoided. It is always wrong in the *same register*. For example:

\*1) It is palpably incorrect to place the suspension *f* and its resolving-tone *e* close together in this way. — \*2) Not as bad as the preceding, because the conflicting tones are farther apart. But it is scarcely admissible, as the tone involved is the weak 3rd step, which is not duplicable anyway (comp. par. 59). — \*3) The above error is the inconsistency of deferring a tone in one part, and neglecting to do so in another. Therefore the simplest remedy for the blunder is, either not to double the tone, or to defer it in both parts, as here, — from above and below, as double suspension. — \*4) Good, because the *tonic* is duplicable under all conditions. — \*5) The same. — \*6) Good, as the *dominant* is suspended.

Additional illustrations of the suspension:

purpose of deferring or suspending the next note, *c.* — \*2) This appears to be a  $\overset{7}{\text{III}}$ ; but see Ex. 190, Note \*1). — \*3) Appears to be a  $\overset{7}{\text{VI}}$ , and is therefore more plausible than \*2); but it *sounds* more like a double-susp. than like a chord. — \*4) \*5) Appear to be chords of the 6th. — \*6) All 6-4 chords, when used in this connection, partake very largely of the nature of suspensions. — \*7) Looks like a  $\overset{6}{\text{I}}$ , — an impossible “chord.” — \*8) Looks like a  $\overset{6}{\text{IV}}$ ; also impossible. — \*9) *On the contrary*, these soprano notes (*g* and *c*) are *not* suspensions, because they represent chords of undoubted identity.

## SUSPENSION-CHORDS.

377. *a.* Analogously, a *whole chord* may be prolonged from an *unaccented* beat to the following accent, in such a manner that the expected (accented) chord is obviously deferred for a beat or so.

This causes a violation of the rhythmic principle given in par. 85 (which review). But it must be remembered that this rule refers, strictly, only to the *bass tone* (par. 166); and, like all other irregularities, it is entirely permissible when so executed that the *intention* is obvious.

*b.* Any misconception of the rhythm, which may result from such an irregular repetition of the bass tone and chord, should be averted by such means as serve to denote, clearly, *the location of the accents*, — for instance, by strong metric or dynamic accentuations; or by symmetrical recurrence, as in sequences and the like.

For these chord-repetitions the term “suspension-chords” seems appropriate. For example:

Ex. 292.

1. *Moderato* MENDELSSOHN

2. *Allegretto* MENDELSSOHN

3. *Adagio* BEETHOVEN

The musical score consists of three examples, each with a piano (right) and bass (left) line. Example 1 (Moderato) shows a piano line with chords and a bass line with a steady eighth-note accompaniment. Example 2 (Allegretto) features a piano line with chords and a bass line with a steady eighth-note accompaniment. Example 3 (Adagio) shows a piano line with chords and a bass line with a steady eighth-note accompaniment. Annotations include 'S.ch.' for suspension chords, 'sf' for dynamic accents, and slurs for grouping notes.

\*1) A “susp.-chord,” repeated from the preceding measure. The correct rhythm is so clearly defined in the preceding measure that all danger of misconception disappears. — \*2) The stagnating effect of the ties is counteracted by the strong accentuations in bass. — \*3) Here the location of the beats is marked by the dynamic accentuations (*sf*), and also by the slurs, which indicate which tones *together* constitute a beat. — See also Ex. 217, No. 1; and Ex. 228, No. 8.

Schumann, as a rule, takes but little pains to preserve the fundamental rhythm, as the following extracts prove:

SCHUMANN idem. op. 99, No. 12

Ex. 293.

(etc., during 40 meas.)

S. S. etc.

See, to the contrary: Schumann, "Bunte Blätter," op. 99, No. 11, Trio; and No. 12, measures 5-7; 9-11; 16; 20, etc.

FUNDAMENTAL PRINCIPLES.

The suspension is a prepared neighboring-note, — held over from one chord into the next, and resolved diatonically.

Suspensions appear on accented beats, or accented fractions.

A suspension should not clash with its resolving-tone in another part, unless the latter is a strong tone which may be doubled in any case.

Rhythmic irregularities are corrected by strong accentuations, or by symmetrical arrangement.

EXERCISE FIFTY-NINE.

A. Basses, to be worked out and analyzed as usual. The student is recommended to tie every susp. to its preparing-tone (par. 375c).

FAISSR

BACH

\*1) These slurs before the bass figures signify that the first bass note is a susp., and therefore the upper parts are to take, at once, the chord indicated by the following figures. — \*2) Rhythm ♩ or ♪; the latter is the best.

B. The following plain chord-progressions are to be modified with suspensions on the first beat of each measure, as follows: (1) in soprano alone; (2) in tenor alone; (3) in alto alone; (4) in any two parts together; (5) in all three upper parts; (6), (7) and (8) in alternating (single) parts, occasionally including the bass. First review Ex. 287, Note \*3). — This exercise may be first written out and then played; or it may be done at sight at the piano.

\*1) These unequal 5ths are divested of their disagreeable effect when a susp. is used in any of the parts. — \*2) In this measure a susp. may be made at each beat, as ♩ note.

C. Play the following chord-progressions, at sight, with a variety of suspensions, using every major and minor key: I — V || I — V<sub>2</sub> || V<sub>1</sub> — I || V<sub>3</sub> — I || I — IV || IV — I || I — V<sub>0</sub> || V — VI ||.

D. A large number of Original phrases.

IRREGULAR RESOLUTIONS OF THE SUSPENSION.

378. In order to be strict, the suspension should resolve itself at once, before the harmony can change, — as above. But this strict treatment is by no means obligatory. Very ingenious effects may be obtained by changing the chord at the moment that the suspension resolves. This simply involves a progression in one or more of the other parts, simultaneously with the progression of the suspension into its resolving-tone.

379. The rules for this "delayed" (or "compound") resolution are as follows:

- a. The suspension can not evade its resolution, but *must progress diatonically* into its resolving-tone. Hence,
- b. The other parts must progress into some chord which contains this resolving-tone. This may be *any* chord, of the *same key*, or of *another key*, — but it is most likely to be merely a new form (or inversion) of the proper chord itself. Thus:

Ex. 294.

a. (Same chord.)      b. (New chord.)      c. (New key.)

S.      S.      S.      S.      S.      S.      S.      S.

\*1) (Ex. 287.)      \*2)      \*3)      \*4)      \*5)      \*6)      \*7)

I   I<sub>1</sub>   V   V<sup>7</sup>   V   V<sub>0</sub><sup>b</sup>   S.   I   VI   I   II<sup>7</sup>   C   G   C   Ab

e

\*1) The bass and alto make a progression at the same time that the suspension in soprano makes its resolution, so that the chord *changes its inversion*. — \*2) The bass moves, and changes the *concord* V into the *discord* V<sup>7</sup>, during the res. of the S. — In the following meas. it is changed into a dim. 7th. — \*3) Here, the *arrangement* of the chord is simply altered, by exchanging tenor and soprano. — \*4) In this meas. the progressions in bass and tenor result in a change of the original chord (I) into its relative (the VI); but the res. of the S. in soprano is not interfered with. — \*5) The resolving-tone of the S. in alto becomes a *seventh*. This is unique, but perfectly justifiable. The parallel fifths in the inner parts are not wrong, because the first one embraces a *suspension*, and is therefore *not harmonic*. The rule applies only to fifths which are *perfect* and *harmonic*. — \*6) The progressions in tenor and bass change the key; this is allowed if effected smoothly and without interfering with the res. of the suspension. This last beat might also be the I of F, the V<sup>7</sup> of F, the V<sup>7</sup> of B<sup>b</sup>, the dim.-7th of b<sup>b</sup> or of e or of g, the V<sup>7</sup> of G, the V<sub>0</sub> of E<sup>b</sup>, or the I of A<sup>b</sup>, as at Note \*7). Write out each of these, — and others, if possible.

380. Two other licences may be mentioned in connection with the above "delayed" resolution, namely:

- a. The *prolonged suspension*. In this case the suspension is held (precisely like the short organ-point) *beyond the beat* upon which its resolution is due, so that the other parts move *before* the susp. is resolved.
  - b. The *passive resolution*. Here, the suspension is extended, as at a, but the other parts progress in such a manner as to meet the susp. and make it *harmonic*. It is, in reality, merely a more systematic variety of the short organ-point.
- N.B. — In all of these cases the suspension (as neighboring-note) *must* make its proper diatonic resolution.

For example:

Ex. 295.

a. (Prolonged S.)      b. (Passive res.)

S.      S.      S.

\*1)      \*2)

I   I<sub>1</sub>   VI   V   V<sup>7</sup>   aV   C   V   (I)   V<sup>7</sup>   I   (aV)   I

S. ————— S. —————

S. ————— S. —————

C V I (V) I a V (CII) V C V I (II V) I

S. S. SCHUBERT BEETHOVEN

S.ch. S.ch.

\*4) \*5)

7 V I (V) I C IV G V<sub>0</sub> I C II 7 V I

\*1) The susp. *d* in soprano is prolonged past its own beat into the 2nd beat, and resolved on the 3rd beat. — \*2) The susp. *c* in tenor is extended into the 2nd beat, and becomes harmonic at that point (root of the I) by the progression in the soprano. — \*3) This is a mode of embellishing the perf. cadence, which is quite common in older classic music. — \*4) This *c* in soprano is really an organ-point; but its preparation and resolution confirm the nature of the suspension. — \*5) The bass makes two progressions before the susp.-chord is resolved.

381. *a.* The resolution of a suspension may, furthermore, be *deferred*, exactly like that of the dominant dissonances (Ex. 156*a*), by *interposing any convenient interval of the resolving-chord* between the susp. and its resolving-tone, or its repetition. Ex. 296*a*.

*b.* The suspension, being a neighboring-note, is entitled to that licence of the latter which consists in passing over into the *other neighbor*, before the principal tone follows both. See par. 409, 410. This may be done while the chord remains the same (Ex. 296*b*); or the other neighbor may have its own chord (Ex. 296*c*). In either case, *the principal (resolving) tone should follow*.

*c.* The suspension may be *transferred* to another part, when *the chord remains the same*. And double- or triple-suspensions may exchange parts. Ex. 296*d*. But the suspension should always be resolved in the part where it last appears.

*d.* In some rare cases the suspension, after moving *downward to some other active tone* (like the leading-tone, or a seventh), may *evade* its resolution; comp. Ex. 168, Note \*3). Ex. 296*e*. For example:

*a.* (Deferred resolution.)

S. ————— S. ————— SCHUMANN

S. ————— S. —————

\*1) \*2)

I I

Andante

*b.* (Double neighbor)

*d.* (Transferred susp.)

*e.* Exceptional

\*1) The resolution of the susp. *d* is deferred by *e*, the 3rd of the resolving-chord. — \*2) The susp. *d* resolves properly to *c*, after *g* has been interposed. The same susp. recurs two measures later, in another part. — \*3) The susp. *f* is the upper neighbor of its resolving-tone *e*; it passes over into the lower neighbor *d*, and the principal tone follows and resolves both. The same act takes place in the tenor. — \*4) Here the interposed lower neighbor (*d*) is harmonized separately. And in the next measure the same occurs. — \*5) The susp. is transferred to tenor and resolved there. — \*6) The suspensions in soprano and tenor change places. — \*7) The susp. in soprano moves down to the leading-tone, and thus evades its own resolution. — \*8) The resolution of *f* is evaded by passing down to the chord-7th. — See par. 426.

EXERCISE SIXTY.

A. Bases, to be worked out and analyzed.

HEWISON

\*1) Exercise 59 Note \*1). — \*2) Rhythm ♩ ♩. — \*3) *D* in soprano. — \*4) Rhythm in these measures, exceptionally ♩ ♩; see Exercise 24, Note \*3). — \*5) The groups of figures which belong to one single bass note denote exactly the course of the parts, as usual.

B. The following period is to be completed, by filling in the 2nd beat of each measure, according to Ex. 294; i.e., one or more of the parts must make a progression at the same time that the susp. (on the 1st beat) is being resolved diatonically downward.

C. Add a number of Original phrases, or periods.

IRREGULAR INTRODUCTION OF THE SUSPENSION.

382. Although the suspension is defined as a *prepared* dissonance, it is not necessary to prepare it *in the same register*. As neighboring-note, it has a right to enter in any rational manner, and it fully asserts its place among those tones of its class which have the advantage of "preparation," if it has a place *anywhere in the preceding chord*, — perhaps as possible seventh, or even ninth, *understood*. This irregular introduction is best in soprano, but admissible in any part. For example:

Ex. 297.

\*1) The suspension *d* in soprano is not "prepared" where it appears, but in the alto, on the preceding beat. The small note in brackets is not to be played, as it is placed there merely to show that the suspension is actually harmonic in the foregoing chord. — \*2) The suspension *f* does not appear in the preceding chord at all, but is *understood*, as very prob-

able seventh. — \*3) The suspension is an understood ninth. — \*4) Understood 7th, entering diatonically (as passing-note). — \*5) The suspension *d*, in tenor, is prepared in the soprano. — \*6) An understood 7th of the preceding II. — \*7) Understood 7th of the IV. This is somewhat far fetched, but defensible. — \*8) Very doubtful, because of the clash on the 3rd step in the outer parts.

383. Sometimes the suspension is properly prepared, in the same part, but *intercepted* by some other interval of the same chord. Thus:

Ex. 298. *Lento* MOZART

Additional illustration:

Ex. 299. *Allegro* BEETHOVEN

\*1) The resolution of the susp. *b* (in sopr.) is deferred by the interposition of *c*. — \*2) The susp. *g* is a possible 7th of the preceding chord (II). — \*3) These suspensions are also 7ths of the foregoing dom. chords.

See Mendelssohn, Songs without Words, No. 2, measures 33, 37, 39; No. 4, measures 7, 8, 14, 15; No. 18, measure 4; No. 19, measure 5; No. 20, measures 3, 11, 18, 19; No. 26, measures 6, 10, 11.

EXERCISE SIXTY-ONE.

\*1) The suspensions may be introduced strictly, as before, or irregularly, as shown in Ex. 297. The choice is left to the student, but preference is to be given to the *free* introduction. — \*2) Suspensions strict. — \*3) Suspensions all irregular, and chiefly in soprano. — \*4) Exercise 59, Note \*1). — \*5) The chord of the 7th falls on the *first* beat. — \*6) It is not unusual for a phrase to end thus in the pos. of the third. Such perf. cadences are called “Incomplete.” — \*7) These letters indicate the soprano notes.

Add a number of Original phrases or periods.

THE HARMONIZING OF MELODIES, WITH SUSPENSIONS.

384. The treatment of certain tones of a given melody as suspensions may be obligatory or optional, according to circumstances. The rules are as follows:

- a. Only *accented* beats (or the accented fractions), and
- b. Only such tones as *progress diatonically* (as resolutions), may be regarded as suspensions (par. 375d).
- c. If the accented tone which progresses thus is *tied to, or repeated from, the preceding tone*, there is every reason to suppose it to be a suspension, with regular preparation; but,
- d. Even when such a tone enters with a *skip*, it may be a suspension, with irregular introduction (as above).
- e. The principal guides will be the natural or necessary order of chords, and the character of the melody.

EXERCISE SIXTY-TWO.

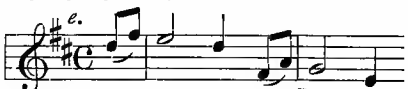

Melodies, to be harmonized with occasional suspensions in the given soprano, or *in any other part*.

\*1) Each of these tied notes may be a suspension (par. 384a, b, c). In order to become such, it must be ignored (as inharmonic tone) and the following tone must be harmonized in its place, as if the melody were simply thus:

if he chooses, first harmonize the whole melody in this simple form, and introduce the suspensions afterward. — \*2) This tone becomes a susp. on the 3rd beat. It is clear that this measure differs from the others only in notation. — \*3) This must be again the V, because the preceding leading-tone (c#) leaps downward. — \*4) May be a minor, or a mixed chord of d minor. — \*5) It does not matter, of course, whether the tone is tied or re-struck, at the accent. — \*6) G major. —

\*7) Modulations at option. — \*8) Melody originally:  etc. — \*9) At these (and other)

points the suspensions may be irregularly introduced. See par. 384d, and review par. 382. The 2nd note of the slurred group is harmonized on the 1st beat, and the 1st note must belong to the foregoing chord, whose choice it therefore deter-

mines. The 1st two measures of this (5th) melody were then, originally:  etc. —

\*10) b minor I. — \*11) f# min. IV. — \*12) Altered II of A major. The I<sub>2</sub> follows. — \*13) Mixed IV of b minor. The I<sub>2</sub> follows. — \*14) Eb maj. or Ab maj. or f minor.

Harmonize, also, melody e of Exercise 27; and melody a of Exercise 36.

### SECTION 3. THE ANTICIPATION.

**385.** The anticipation is exactly the opposite of the suspension, and consists, as the term implies, in a tone which does not belong (legitimately) to the momentary chord, but to the following one.

It is much less common than the suspension, because it is difficult and unnatural to accept a tone before its time. Therefore, it is limited in its uses. It occurs most frequently: 1st, at cadences; and 2nd, in sequences and the like, where one anticipation appears to confirm and justify the other. For example:

Ex. 300.

Ex. 287-1.

*a.* *b.* *c. Allegro*

*d. Lento*

BACH

B $\flat$  II — I<sub>2</sub> — V<sub>0</sub> — I<sub>1</sub> — IV<sub>1</sub> — I<sub>2</sub> — II<sub>1</sub> — V — V — I

\*1) Ant. or A. signifies anticipation. — \*2) This *c* does not belong to the chord with which it appears, but to the following one. A similar ant. may be made in alto, as shown by the notes in parenthesis. — \*3) Any series of chords may be embellished (in any part or parts) with anticipations, as shown here. — \*4) Here the anticipations (in bass) are tied to the anticipated tone. This is quite unusual, because of its unfavorable effect upon the rhythm. It is best in rapid tempo. See also:

Bach, 48 Preludes and Fugues, Book I, Fugue No. 14, measures 8, 9; 15, 16; 19, 20; 21-24 (bass); 35-38.  
 Beethoven, op. 49, No. 2, 2nd movement, first measures.

HINTS AND DIRECTIONS.

386. *a.* Anticipations are most intelligible in soprano, but are possible in any part.

*b.* The ant. should not exceed in duration *half* the value of the chord in which it occurs; the shorter it is, the more easily it will be recognizable as a foreign element, and the less it will endanger the rhythm.

Ex. 301.

A. A. A. A.

Good ??

*c.* Anticipations differ from suspensions in their rhythmic location, being always found upon *unaccented* beats, or weak fractions of beats, whereas suspensions occupy *accented* beats, or accented fractions (par. 375*d*).

*d.* Anticipations are generally re-struck; seldom *tied* to the anticipated note. Ex. 300, Note \*4).

*e.* An anticipation may be introduced from *any* lower or higher tone. As it pertains exclusively to the tone which *follows*, the manner of its introduction is of no consequence.

## HARMONIC ANTICIPATIONS.

**387.** Anticipations may be *harmonic* as well as suspensions. If a tone bears a closer and more legitimate relation to the following chord than to its own, and, especially, if it is comparatively *short*, it will produce the impression of an ant., whether it is inharmonic or not. And, on the same principle, the *whole following chord* may be anticipated. Review pars. 376, 377.

*Harmonic* anticipations are preferable to inharmonic ones, because they sound better, and disturb the harmonic sense less than the latter. For example:

Ex. 302.

*a.* A. A. (?) A. *b. Allegro* MENDELSSOHN  
Ant. Ant. Ant.

*c. Andante* HAYDN *d.*  
A. A. A. A.ch. A.ch.

\*1) This *c* might represent the IV, and almost surely would, if it were not so *brief*. — \*2) The *f*, as half-beat, is probably a legitimate seventh; but its relation to the following tone gives it the appearance of an anticipation. — \*3) Anticipating-chord. In these two phrases, the 2nd chord of each beat is an ant. of the following beat.

**388.** When, as here, a chord is repeated over the bar (or accent) in violation of the rule of rhythm in par. 85, it may be difficult, or even impossible, to determine accurately whether the first chord is an anticipation of the second one, or the second a prolongation (as suspension) of the first. (The tied notes, in the right hand *alone*, in Ex. 292, No. 2, might be analyzed in either way.) In cases where there is the least doubt, it *does not matter how they are construed*. The main (and essential) requirement is, to *define the fundamental beats* so clearly that no confusion of rhythm can possibly result. This matter is explained in par. 377*b*, which review. The following is an interesting and simple example of both cases in succession:

Ex. 303.

*Allegro* BEETHOVEN  
S. — Ant. —  
V I V I

389. There is no doubt of the following examples being anticipating-chords, principally on account of their brevity. They might aptly be termed "rhythmic anticipations," as they do not affect the fundamental harmony in the least.

1. *Allegro* BEETHOVEN. *Op. 31, No. 1.* (*throughout the 1st mov't*)

Ex. 304. Ant. A. A. A. etc.

2. *Adagio* BEETHOVEN *tr* 3. *Moderato* WAGNER

Ant. Ant. Ant. Ant.

G<sup>ph</sup> V<sub>0</sub> I — 7 II — I

See Ex. 309, Mozart, measure 3.

SYNCOPATION.

390. Syncopation is the term applied to that kind of irregular rhythm in which the longer tones, occupy comparatively weaker beats, or, more specifically, fall between the beats. It is simply a violation of the metrical accentuation (see par. 4, and Ex. 5, f, g, h, i), and results from tying an unaccented beat, or fraction of a beat, to the following accented beat, or full beat.

It is the most perspicuous example of "oblique rhythm" (par. 374, last clause), because the syncopated part or parts are literally bent forward or backward so as to differ (by a beat, or fraction of a beat) from the other parts, which mark the regular rhythm.

391. Whether the syncopated notes, when they fall exactly between the beats, are suspensions or anticipations, depends of course upon which way they were "bent;" that is, whether they belong to the following or preceding chord. Sometimes, as stated in 388, they can be accounted for in either way, and, as a rule, it is quite unnecessary to consider this doubtful question at all. The notes can be produced, and defined, simply as "oblique rhythm," or "syncopation." In the following example the distinction is very plain at a and b:

FAISST

a. S. S. S. S. b. Ant. Ant. Ant. A.

\*1) \*2)

and

instead of etc.

Ex. 305. I V I I I V I

BEETHOVEN.\*4)

\*1) These syncopated soprano notes, which fall *exactly between the beats*, belong in each case to the chord which *precedes*, and therefore become suspensions. — \*2) Here the very same notes, owing to an alteration in the location of the chords, are anticipations of the *following* beat. The direction of the oblique rhythms is indicated by the slanting lines. Such double treatment is possible only *when the melody moves diatonically* (i.e., stepwise), — as this is necessary in order to resolve the tones *when suspensions*. — \*3) The syncopated notes in the “left hand,” being struck *after* their beat, become suspensions. — \*4) Piano Sonata, op. 2, No. 3, 1st movement; see also measures 11, 12 (bass); also *from the double-bar*, measures 26, 27; 30, 31; 34-37; 58-65.

392. Upon this principle of oblique rhythm in one or more parts of the harmony, very unique effects may be produced. For instance, any two parts of the harmony (the two hands in piano music and the like; or one voice against the other three; or the melody against the accompaniment, etc.) may appear *successively*, instead of simultaneously (Ex. 306 a, b, c). Or the chords may be “broken” (“arpeggiated” — as in Figuration) across two beats or rhythmic groups: *i.e.*, partly in one and partly in the next. For illustration:

Ex. 306.

a. *Presto*      b. MENDELSSOHN.\*2) *8ves*      c. *Presto*      MENDELSSOHN

d. \*4) *Allegro*      e. *Presto*      SCHUMANN. Op. 9

Ant.      etc.      Ant. Ant. simile

*f. Presto* *Sua* *loco* MENDELSSOHN. Op. 29

The image shows a musical score for Mendelssohn's Op. 29. It consists of two staves: a treble clef staff (piano) and a bass clef staff (bass). The tempo is marked *f. Presto*. The key signature has two flats (B-flat and E-flat). The time signature is 6/8. The score is divided into sections: *Sua* and *loco*. The piano part features slanted stems and markings 'Ant.' (anticipation) under several notes. The bass part has markings '8' under some notes. The score ends with 'etc.'.

\*1) At *a*, *b* and *c* the harmony is divided between the two hands, which strike alternately, instead of together. This does not affect the harmony at all, but simply the *rhythm*, which it makes "oblique," as indicated by the slanting lines. — \*2) *Variations sérieuses*, op. 54, Finale; see also Var. 5, 11, 15. — \*3) These rests remove the appearance of syncopation, but it is clear that they merely take the place of *ties*. Thus:

A small musical notation showing a single note on a treble clef staff with a slanted stem, followed by a rest and the word "etc.".

See also Mendelssohn, op. 72 No. 6, measure 3-5, 11-13, etc. And Ex. 325, No. 3. — \*4) These eighth-notes, with connected stems, should occupy a beat together, instead of lying across the bars (or beat-lines). The heavier bass tones define the rhythm. — \*5) The left hand here, is like the right hand at \*4). This example is from Schumann's "Carneval" ("Paganini"). See also his "Fabel," op. 12. — \*6) The connected stems define the "broken" chord; the brackets define the half-measure groups. Their disagreement is somewhat similar to \*4). — See further:

Schumann, Phantasie op. 17, 1st movement, measures 95, 96; 105-118 (bass); 2nd movement, measures 22-25 (soprano); 62-65 (bass); also the last 28 measures of the same movement; 3rd movement, measures 27, 28. — Schumann, op. 6, No. 4.

N.B. — These oblique rhythms are intelligible and effective only in rapid tempi, where the conflicting harmonies are of but short duration.

393. The anticipation sometimes serves merely to prepare a suspension. In such cases the ant. is generally harmonic, but not necessarily so. For example:

Ex. 307.

*a. Allegretto* BEETHOVEN *b. Andante* SCHUBERT *c.*

The image shows three musical examples labeled a, b, and c. Example a is by Beethoven, marked *Allegretto*, in 2/4 time. Example b is by Schubert, marked *Andante*, in 3/4 time. Example c is also in 3/4 time. Each example shows a treble clef staff with notes and rests, and a bass clef staff with chords. Markings 'A. S.' (Anticipation and Suspension) and 'A. S. A.' are placed above the notes. Roman numerals C I, I, I<sub>1</sub>, II, and V are placed below the bass staff. The word 'etc.' is written below the first two examples.

Compare Ex. 297, measures 1, 2 (parenthesized notes).

FUNDAMENTAL PRINCIPLES.

The anticipation is a tone, usually inharmonic but possibly harmonic, which belongs to the *following* chord.

Anticipations are always unaccented, and generally very short.

Syncopation is a violation of the metric accentuation, and usually represents the location of a tone *between* beats, instead of upon the beat (or rhythmic group).

## EXERCISE SIXTY-THREE.

A. The following chord-series (in period-form):

Ex. 308.

is to be elaborated with anticipations (either at the piano, *at sight*, or as written exercise) in the following ways:

a. *Andante*      b. *Lento*      c. *Allegro*      d.      e.      f.      g.

h. *Presto*      i.      j.      k.

\*1) It is by no means unusual to add supplementary notes here and there, as in these last two chords, and the student may hereafter practice this licence of *altering the volume* of the harmony (either by additions or by *omissions*), wherever his taste and judgment suggest. See par. 462. — \*2) Ex. 302, measure 1. — \*3) Ex. 302d. — \*4) Ex. 300c. — \*5) Ex. 306b. — \*6) The 3 upper parts may be written in a group upon the upper staff, as here, wherever desirable. — \*7) Ex. 306d.

B. Melodies, with anticipations, to be harmonized as usual.

a. *Andantino*

\*1) All of these short notes must be harmonized as anticipations; that is, they are simply ignored altogether, because they do not belong to the beat in which they occur, but to the following one. — \*2) D maj. or b minor. — \*3) Compare Exercise 22, melody f. — \*4) Par. 393. — \*5) Single anticipations, or, better, *anticipation-chords* at each 16th-note. — \*6) These two melodies, consisting of *stepwise progressions*, are to be harmonized in two ways: (1) so that the syncopated notes will be *suspensions* (on the accented fraction of the beats); and (2) so that they will be *anticipations* (on the weak fraction), as shown in Ex. 305, a and b. Melody e will be thus reduced to its primary form:

- 1. For suspensions:
- 2. For anticipations:

\*7) The weak fraction of nearly every beat is to be an anticipation, or ant.-chord. The three upper parts may be placed together on the upper staff, as at Ex. 308g, Note \*6).

C. A number of **Original phrases** and periods.

THE IRREGULAR ANTICIPATION.

394. The irregular anticipation is the counterpart of the irregular suspension, and is so called because it *progresses with a skip*, instead of remaining upon the note which it anticipates. The anticipated note appears in some other part, or it is *understood*, as possible seventh (ninth?) of the next chord. Comp. par. 382.

- a. This licence is most effective in the soprano.
- b. As a rule, the irregular anticipation skips *downward*. For example:

Ex. 309.

\*1) This mode of treating the anticipation, although a licence, is preferable to the strict treatment. In almost all of the above illustrations, the irreg. anticipation (in soprano) reappears in the next chord in the tenor. — \*2) The skip *upward* from the irreg. ant. is exceptional. — \*3) The irreg. ant. in *bass* is very unusual and difficult to justify.

EXERCISE SIXTY-FOUR.

Melodies, with irregular anticipations.

a. *Molto mod.*

b. *Allegretto*

c. *Moderato* A. A. A. A. A. d. *Andante* A.

\*1) The slurred notes are harmonized with one chord, in such a way that the second fraction of the beat becomes an anticipation. If, as here, it progresses with a leap, the *next* chord must contain it (par. 394). Melody *a*, reduced to its

primary form, would be:

etc. — \*2) Dominant

organ-point during this measure. — \*3) Each 16th-note an irreg. anticipation. — \*4) In order to be a genuine, *inharmonic*, anticipation, the first tone of the beat must be harmonized with a chord which *does not contain the second tone*.

Add **Original phrases** and periods.

SECTION 4. THE NEIGHBORING-NOTES.

395. Every tone in music is attended by four neighbors, consisting in the *next higher and next lower letters*, in their notation as *whole step and half-step*. Thus, of the tone C:

Ex. 310.

\*1) A *chromatic* tone cannot be a neighboring-note, because the *letters* must differ.

396. A neighboring-note may appear in almost any connection *with its own harmonic tone*, — called the principal tone, — as unessential or embellishing tone. This is valid in its most comprehensive application, and is due to *relation by propinquity*, — the third of the three classes of relationship which govern musical associations. See par. 40.

There are two classes of neighboring-notes, namely: 1. The simple embellishing tone or **neighboring-note proper**; 2. The **passing-note**.

THE NEIGHBORING-NOTE PROPER, AS "LOCAL" EMBELLISHMENT.

397. The term *local* embellishment may be applied to that form of association in which the neighboring-note *returns to the same principal tone from which it proceeded*. In such cases no other harmonic interval is involved than the one principal tone, and the embellishment refers to that one tone only. Thus (the neighboring-notes are marked o):

Ex. 311.

\*1) The *d* in soprano is the upper neighbor of the chord-interval *c*. It comes from it and returns to it as simple "triplet" embellishment of that one tone. This process can be applied to *any* chord-interval, as in the following measures (*g* in alto, *e* in bass). — \*2) Possible in any rhythm. — \*3) The *b* in soprano is the lower neighbor of *c*. — \*4) The accented neighboring-note has the effect of a suspension, but is not prepared. Comp. par. 373.

398. All the common forms of embellishments or "grace-notes" (the turn, trill, appoggiaturas, mordent, etc.) are based upon such association or alternation of a principal tone with one or another of its neighb.-tones. Thus:

Ex. 312.

\*1) The *key* determines the choice of neighboring-note. See par. 399, rules.

399. The choice between the four possible neighbors is not altogether optional, and sometimes very important. The rules are as follows:

a. The lower neighbor is generally chosen in embellishing a principal tone which is about to ascend. And the descending principal tone usually takes the upper neighbor. This is almost obligatory when the principal tone moves stepwise.

b. The upper neighbor always agrees with the momentary scale (or key). The lower neighbor may also agree with the scale, but it is usually the half-step. For example:

Ex. 313.

\*1) The lower neighb.-tone is not good here, because it is not the right direction into the next (lower) principal tone. — \*2) In older music the *lower* neighb.-tone was also made to agree with the scale; but when it is a *whole* step, it is sometimes stiff. — \*3) The most notable exception to the *lower half-step is made at the leading-tone*, which is almost always embellished by the *natural* 6th step, which lies a whole step below. — \*4) Comp. Note \*1). — \*5) C major. See rule *b*, above.

THE PASSING-NOTE, AS "PROGRESSIVE" EMBELLISHMENT.

400. *a*. When a neighboring-note, instead of returning for resolution to its own principal tone, progresses in the same direction *diatonically* into another principal tone (or into the neighboring-note of the *next* principal tone), it is called a **passing-note**, because it becomes a medium in connecting the tones of which it is a common neighboring-note.

*b*. The passing-note may be *unaccented* or *accented*, at option. The only difference is, that the accented passing-tone is the more emphatic and effective.

*c*. In notation, the passing-notes agree with the prevailing scale. See Ex. 329, Note \*5).

*a*. Unacc. passing-notes (+):

*b*. Acc. passing-notes (x):

*c. Lento* BEETHOVEN

\*1) The descending passing-note, when unaccented, often has the *appearance* of a chord-seventh. See Ex. 186, Note \*3). — \*2) The *accented* passing-note, from *below*, is occasionally subject to par. 399*b* (a half-step). Here *f#* sounds better than *f*. — \*3) The descending passing-note, when *accented*, is often identical with the irregular suspension. See Ex. 297, Note \*4).

401. *a*. The space between two harmonic intervals in the same part may be filled out in this manner diatonically, even when *two* intermediate passing-notes are required; that is, *passing-notes may occur in direct succession, in the same direction*.

b. Chromatic passing-notes are possible, to the extent of 3 or even 4; but they should be limited as much as possible to ascending progressions. Descending chromatics in rapid succession are peculiar, and appropriate only for brilliant effects. This applies only to rapid successions. In slow tempo, chromatics are effective in either direction.

Ex. 315.

a. S.

b. \*1) \*2) \*3) \*4) \*5)

c. Andante SCHUBERT etc.

\*1) The combination of a chord-tone and its chromatic inflection (as passing- or neighboring-note) is possible, as here. But it is just as well to avoid it, if convenient. — \*2) Descending chromatic pass-note. — \*3) In such ornamenting groups as these, the larger intervals come first in the group, as a rule, — as in the preceding group. — \*4) The notation of chromatic tones must conform to the principles of next-relationship (to the prevailing key), and will be found to coincide exactly with the altered steps. Therefore, not all ascending tones are written with sharps, nor all descending ones with flats. In this case  $f\sharp$  is the only correct notation, irrespective of direction;  $g\flat$  would be absolutely wrong, as it is too foreign to the key (G or C). — \*5) This might be a chord, — the IV of  $c\sharp$  minor.

#### EMBELLISHED MELODY, AND RUNNING PARTS.

402. Neighboring- and passing-notes may be employed in embellishing any single part, in uniform rhythm, — as a so-called running part.

The following melody, and its embellishments, appears in op. 74 of Beethoven:

Ex. 316.

Andante

V I IV II V V I

c. *Allegro*

Accompanied by the bass, in 3rds.

Also Beethoven, Sonata op. 2, No. 2, last movement; compare measure 3 with measure 13 from the end.

403. Ampler forms of embellishment (*i.e.*, larger groups of notes, and in more rapid rhythm) usually develop out of the simplest original figures, by adding neighb.-notes. Thus:

Ex. 317.

FUNDAMENTAL PRINCIPLES.

One, or more, of the four adjoining tones of any harmonic interval may be used in connection with the latter, as simple neighboring-note, or as passing-note.

The *neighboring*-note enters from, and returns to, its principal tone.

The *passing*-note, or notes, connects two different principal tones, diatonically, — more rarely chromatically.

The upper neighbors, and all passing-notes, agree with the momentary scale. The lower neighbor is usually a half-step, excepting at the leading-tone.

EXERCISE SIXTY-FIVE.

A. The following melodies are to be embellished *alone*, in a *uniform rhythm* of 2, 3 and 4 notes to a beat, successively (see models, and rules below):

I — II<sub>1</sub> — V —  $\bar{V}$  I      I    V<sub>1</sub>    I    V    I<sub>1</sub>    IV    II<sub>1</sub>    I<sub>2</sub>     $\bar{V}$     I

I      V<sub>1</sub>      I      b $\bar{V}$       I<sub>1</sub>      f $\sharp$  $\bar{V}$       I       $\bar{V}$       I

Models (No. 1)  
(Rule 3)

2 notes to a beat      3 notes

(Rule 2)

4 notes

**Rules:** (1) The running rhythm must not be changed until the cadence-note is reached. The latter is *not* embellished.

(2) The given melody may, *occasionally*, be modified by adding other principal tones of the momentary chord; especially an intermediate interval, when the skip is large.

(3) As a rule, the original location of the given melody-tones *in the measure* should be retained. But this is not always possible, and it is effective to place an *accented passing-note before the given tone*, — as in the above model, first measure, beats 2 and 3; 4th measure, beats 2 and 3. See also Ex. 314b.

(4) The embellished part must run smoothly; repeated tones, in quick succession, should be avoided.

(5) Play the given chords with the left hand. Review pars. 399, 401.

**B.** The following period is to be supplied, first, with a *running bass*; then with a *running alto*; then with *alternating bass and tenor*, or *alto and tenor* (in successive measures, — or whenever convenient). In each case in a continuous rhythm of first three, and then four, notes to each beat. See models, and rules below.

cad.      Models:

Rule 1      Rule 1

6  $\frac{6}{4}$  2 6  $\flat_6^6$  6 6 4  $\flat_6^6$  6  $\frac{6}{6}$  6  $\flat_6^6$  7

**Rules:** (1) The adopted rhythm must not be interrupted at the semi-cadence; and even at the perfect cadence it should continue for one beat past the final note in soprano.

(2) The inner parts may be first filled in, and then embellished (like the given bass); or the running rhythm may itself determine the principal tones, — at least partially. The given bass, and the chords, may be changed, if necessary.

(3) The compass of the parts, and their distance apart, is optional.

(4) The embellishing part must run smoothly (rule 4, above). *Sequences*, and general *uniformity of figures*, are extremely important in running parts.

See also: Mendelssohn, op. 54, Var. I; op. 82, Var. II. — Beethoven, op. 120, Var. 25. — Cramer, Études 41, 80, 16, 32 (original complete edition).

**C.** Construct a few **Original phrases**, with running parts.

EMBELLISHED HARMONY.

404. Instead of limiting the neighboring- and passing-notes to the embellishment of one *single* part, as above, they may be employed *in all of the parts, in alternation*, for the purpose of filling out the spaces between the harmonic intervals. This makes the harmonic impression smoother, creates a more animated rhythmic effect, and adds greatly to the melodic significance of the parts.

405. Hints and directions.

a. All embellishing notes progress **stepwise**, — usually *diatonically*.

b. *Unaccented passing-notes* are almost everywhere good. *Accented* ones are apt to clash too harshly with the other parts; but they are often very effective, and should not be avoided. A test by ear is all that is required.

c. When embellishing tones occur simultaneously in two different parts (as they may), they should generally harmonize *with each other*. For this reason they are most likely to run *in parallel 3rds or 6ths* (comp. par. 66); or, if they move in opposite directions, they should meet (cross) on the same tone.

Inharmonic tones in three or four parts at once (which is possible, but rare) should represent *passing-chords*, or *neighboring-chords*. For example:

Ex. 318.

1. *Lento* BACH

Chord symbols:  $E_b I_1$  —  $V_7$  —  $VI$  —  $VI_1$

2. *Presto* BEETHOVEN

Chord symbols:  $C I$  —  $II$  —  $V$  —  $I$

3. *Moderato* BRAHMS

Chord symbols:  $B_b I$  —  $V_9^b$  —  $E_b V_7$  —  $I$

Org.-pt. *8ves.*

4. *Allegro* BEETHOVEN

Chord symbols:  $C I$  —  $C V_7$  —  $F V_7$

and and

f. The rhythm of the *soprano*, as most conspicuous part, should always be as regular as possible (*i.e.*, the rapid notes should fall on the weaker beats).

Therefore, the first measure of Ex. 320b would be better thus:

g. Regular anticipations, and *quick repetitions generally*, should be avoided, as they jar the movement. Repetitions, however, are usually good, no matter how abrupt, *when the second tone is a suspension* (Ex. 322-2), — and when they occur in *sequences* (Ex. 322-3). For example:

In other words, calculate the group of tones so that it will run into the next harm. interval *at precisely the right moment*; not *before* its time, as in Ex. 322-1.

h. *Short rests* constitute a very valuable resource of harmonic embellishment, and may be freely used. As a rule, a rest may be substituted for the *first stroke of any group*, excepting after an inharmonic note, or after a very short note.

*Ties* are still more valuable, but must be used with caution. The principal rule is, that it is unwise to *tie a short note*; in general it is best to tie nothing shorter than a beat, or a half-beat in moderate tempo. But exactly the same exceptions are valid as in 405g, — for quick repetitions. Thus:

A musical score for a piano exercise. The top staff is a treble clef with a melody. The bottom staff is a bass clef with a bass line. The melody includes notes marked with 'x', 'o', and 'Ties'. Dynamics include 'pp' and 'S.'. The bass line has notes labeled 'good', 'or', and 'better'.

i. The embellishment should not continue *in any one part too long*, but should pass from part to part; not in such regular intervals of time as to incur monotony, nor so irregularly as to destroy the rhythmic unity of the whole. It will usually be taken up in that part in which, 1st, the convenient "space" is found; and 2nd, where it conduces most to the melodic quality of the part. A glance at **Bach**, "Well-tempered Clavichord," Book I, Fugue 11 and Prelude 12; and Book II, Fugues 2 and 4, etc., will suffice to show how the parts generally alternate and reciprocate, in keeping up the adopted rhythm.

j. That, from time to time, *more than one part* may be engaged with the embellishment, has already been seen (Ex. 318); and particular attention is directed to the possibility of different parts embellishing simultaneously *in different rhythms* (for instance, in 8th- and 16th-notes).

N.B. The student will find very thorough illustration of this style of writing in the author's *Elementary Counterpoint*, Chap. 24.

**406.** The most of these rules must be applied with discretion, for they are merely general principles, which are subject to modification in the multitude of changing conditions. The student who has mastered the laws of legitimate harmony, who has trained his ear to discriminate rationally between consonance and dissonance, and has made a conscientious study of the masterworks to which reference has been made, may now confidently trust his ear in detecting harsh passages. He is again warned of the utter futility of *working out his exercises at the piano*. The piano should be used, first, *while studying the given examples*; and, second, in *testing the effect of the written work, after it has been completed at the writing-desk* to the best of the student's ability.

## EXERCISE SIXTY-SIX.

A musical score for Exercise Sixty-Six, divided into two parts: A and B. Part A is marked "Andante" and Part B is marked "Allegretto". Both parts are in 4/4 time and feature a treble and bass staff. Part A includes dynamics \*1) and \*2). Part B includes dynamics \*1) and \*2).

*Moderato*

\*1) To be embellished three times, throughout, in *alternating parts*, in a continuous rhythm of first 2 notes, then 3, and then 4, to each beat. Ex. 320b will serve as a model for the 4-tone rhythm. — \*2) The bass carries the adopted rhythm on into the second beat. — \*3) Precisely like A. — \*4) To be embellished twice, in rhythms of 3, and then 4, notes to each beat. — \*5) This brief preliminary beat is not to be embellished.

IRREGULAR NEIGHBORING-NOTES. THE APPOGGIATURA.

407. Either the upper or the lower neighb.-note may be simply *placed before* its principal tone, *without regard to what precedes* — either with a skip, or after a rest, or at the very beginning of the phrase, or in the strict diatonic manner already seen.

Because, similar to the anticipation, a neighb.-tone pertains *exclusively to its own prin. tone, into* which it must be resolved, but *from* which it is not obliged to enter.

408. a. When the neighb.-note enters with a *skip* it is called an **Appoggiatura** (or, if very brief, an *Acciaccatura*).

b. It may stand upon the strong fraction of *its own beat* (like the accented pass.-note), or upon the weak fraction of the *preceding beat*. For illustration:

Ex. 324.

2. *Allegro mod.*

\*1) At each beat marked N.B. the neighb.-tone enters with a skip. This whole passage from **Brahms** is a curious (and intentional) exception to the general rule that a sensitive tone should not be doubled in embellished form. The embellished melody is doubled in the tenor, in *intentional* octaves. — See also: **Beethoven**, Sonata op. 14, No. 2, first 4 measures; **Chopin**, Étude op. 25, No. 5, first section.

THE DOUBLE-NEIGHBOR.

409. a. Analogously, both neighb.-notes may be set before their prin. tone, in either order, and, as indicated in par. 408b, so that both occur *in the beat*, or both *before the beat*, or *one before and the other upon* the beat.

b. This is a double-appoggiatura, and the irregularity consists in the first neighb.-tone *progressing with a skip* (into the other one). Thus:

Ex. 325.

I

3. *Allegro* BEETHOVEN etc. \*5)

4. *Allegro* BEETHOVEN etc.

5. *Allegro* MOZART

6. *Allegro* CHOPIN

F V

\*1) Strike the I with the left hand, at each accent. — \*2) Par. 399b must be respected in all cases. — \*3) This order of tones is not as smooth as the preceding figures. The choice of upper or lower neighb.-tone, as defined in par. 399a, refers to the *last one in the group*. — \*4) When the neighb.-tones are shifted back in this manner, it is simply an example of "oblique rhythm." — \*5) In rare cases, the first neighb.-note returns, as here, before the prin. tone appears. — See also: Weber, "Rondo brillant" in E♭ major.

410. This is a species of "deferred resolution" very often applied to suspensions (which are always "neighb.-tones"). This, and other interesting deferred resolutions, are exhibited in the following example. See par. 381b.

Ex. 326.

MOZART

EXERCISE SIXTY-SEVEN.

*Moderato*

A.  
\*1)

\*1) The *melody alone* of this phrase is to be embellished; first, in 8th-notes, as in Ex. 324-1; second, with 3 notes to a beat, as in Ex. 325-1; and third, with 4 notes as in Ex. 325-2, and Ex. 324-4. The harmony is placed in the left hand, for convenience. — Besides this, the student may take any *short* melodies of former exercises, and elaborate them in the same three ways.

B. The following period (an excerpt from the pianoforte works of C . . .) is to be embellished in *alternating parts*, as in the preceding exercise: first, with 4 notes to each beat; and second, with 3 notes to a beat (as  $\frac{3}{2}$  measure). Any necessary or suitable licences (chiefly those of par. 407, 409) may be applied.

The image shows two systems of musical notation for piano. The first system is marked "seq." and consists of two staves (treble and bass clef) with a key signature of two flats. The second system is marked "In  $\frac{9}{8}$  measure" and "etc." and also consists of two staves with the same key signature. The notation includes various rhythmic figures, including eighth and sixteenth notes, and rests.

C. To this exercise may be added a similar elaboration of some former simple phrases and periods, either original, or given in Parts II and III. Or the student may write a number of **Original phrases**, with direct application of the given material.

#### HARMONIC EMBELLISHMENT (CONTINUED).

**411.** The employment of passing-notes and suspensions, in embellishing the harmony in alternating parts, may become more elaborate and significant by adopting a *small melodic figure* as "motive." This imparts that equality and melodic uniformity to the several parts which is a distinctive trait of the so-called polyphonic (or contrapuntal) style.

**412.** Polyphony is the highest grade of musical technique, and demands great skill in the treatment of musical material. Hence its practice by comparative beginners is out of the question. Nevertheless, a harmonic phrase, embellished with an adopted motive, approaches the idea and resembles the effect of the contrapuntal process, and is well worth the student's attention at this point.

**413.** Thus, any succession of simple chords, — for example:

$$\frac{4}{4} \text{ I—II—V—VI} \mid \overset{7}{\text{I}}—\overset{7}{\text{V}}—\text{I} \parallel$$

may be embellished in many ways, with a variety of motives, as follows:

The image shows two motives and their application in a piano score. Motive 1 is a simple eighth-note figure:  $\text{G}_4\text{—A}_4\text{—B}_4$ . Motive 2 is a triplet eighth-note figure:  $\text{G}_4\text{—A}_4\text{—B}_4$ . The piano score, labeled "Ex. 327", shows these motives applied to a chord progression in C major. The first system shows the motives applied to the first two chords (I and II). The second system shows the motives applied to the last two chords (V and VI). The notation includes various rhythmic figures, including eighth and sixteenth notes, and rests.

3. Motive: 

4. Motive: 

5.  etc.

6.  etc.

7. *Allegretto* 

BEETHOVEN \*8)  etc.

\*1) "Progressive" embellishment, with passing-notes, is more dignified and effective in this semi-polyphonic style. —  
 \*2) "Local" embellishment, on the contrary, while necessary at times, does not contribute to the life and melodic significance of the parts, as the "progressive" does. — \*3) The *direction* of the motive may be reversed, as here, at any point. It is called *imitation in contrary motion*, and is always valid. — \*4) A slight change of the given harmony, for the sake of the motive. — \*5) A "harmonic" motive, obtained by merely breaking the chord. It becomes the basis of the ampler motive in No. 6, — after the manner of par. 403. — \*6) Motive. — \*7) Motive. — \*8) Op. 74; same as Ex. 316.

For further illustration of this style of contrapuntal embellishment, see **Beethoven**, op. 120, Variations 11, 14. — **Mendelssohn**, op. 54, Variation 2; op. 83, Var. 2. — **Bach**, Well-tempered Clavichord, Book I, Preludes 12, 22, 23; Book II, Preludes 5, 11, 19.

In working out the following exercise, the pupil is to use moderately simple chords (and next-related modulations), and then embellish this harmony in a continuous rhythm of *two notes to each beat*, in alternating parts as usual. It is by no means necessary that a motive be adopted, as in Ex. 327, although he may experiment in that fashion; the chief object is, to impart to each voice a definite melodic character, — to make each part a significant line in the design (par. 7).

Before harmonizing the given chorale melodies, the pupil will do well to make a very careful study of the chorale harmonizations of **Bach** (to be found in Vol. VI of his organ music, Schirmer edition (edited by Widor and Schweitzer), or Vol. V of the Peters edition; and in the chorale numbers in his "St. Matthew" Passion). See also **Mendelssohn**, "St. Paul," No. 3, No. 16.

## EXERCISE SIXTY-EIGHT.

**Rules:** (1) Review par. 405a, c, h, and 407. — (2) The given melody is not to be changed, as a rule, but an occasional suspension or passing-note may be introduced in the soprano. — (3) The embellishment may be added after the chords have been found; or the harmony may be determined at once in its embellished form. — (4) The use of regular suspensions (with ties), and of ties generally, is commended.

1. *Moderato* 2. *Adagio*

Chorale 3. *Adagio*

Chorale

4. *Adagio* 5. *Allegretto*

Chorale

DI EV \*6)

I<sub>2</sub> II

6. *Moderato* FAISST

\*1) Besides this melody, add the similar manipulation of some of the melodies given in Exercises 16, 17, 22, 55, and others. — \*2) The end of each line (marked  $\curvearrowright$ ) must be a strong *triad*, and the rhythm is interrupted. — \*3) The pauses ( $\curvearrowright$ ) in this chorale are to be ignored. — \*4) The repetition must be written out, with different harmony. — \*5) Sequences should be treated as symmetrically as possible. — \*6) In this and the following melody the student may work with the utmost freedom, and depend somewhat upon his ear. — \*7) This last melody may be elaborated in several different ways (but only in 8th-notes).

OTHER LICENCES.

414. The upper neighbor may evade its resolution by *leaping down a third*, — not only in passing to the opposite neighbor (Ex. 325, No. 3), but in any case, without ultimate return to its principal tone.

The chief excuse for this is, that the upper neighbor is so frequently an anticipation of the following chord (as in Ex. 309). Another justification would be its occurrence in sequential figures. For example:

Ex. 328. CHOPIN

4. *Allegretto* \*2) BEETHOVEN

5. *Allegro* \*3) BEETHOVEN

6. *Presto* BEETHOVEN

Db I ————— V ————— I

\*1) The *d* in soprano is the upper neighbor of *c*, and leaps down a 3rd; but it is also explainable as an irregular anticipation of the *d* in bass on the next beat. — \*2) These unresolved upper neighbors are sequences of the preceding anticipation *d*. — \*3) In each of these cases the upper neighbor leaps down a 3rd *into the lower neighbor*, — but their common principal tone does not follow. — \*4) Compare this with Ex. 316, from which it is derived. — \*5) These unusual sequences are imaginable only in such rapid tempo. — See also, **Beethoven**, Sonata op. 31, No. 3, first movement, measures 10-9 from the end.

415. During the *regular* local embellishment of a chord-tone, the other parts may make a progression into a *new chord*, so that the prin. tone in the meantime changes its harmonic quality, or becomes *itself inharmonic* (comp. par. 378). Thus:

Ex. 329.

1. *Andante* BEETHOVEN 2. *Moderato* SCHUBERT 3. BEETHOVEN

F I V c V I IV IV V

\*1) During its embellishment, the tone *c* in soprano changes its quality from fifth to root. — \*2) The prin. tone *ab* becomes, upon its reappearance, an accented passing-note. — \*3) These measures prove that this irregularity is but one of the many phases of "oblique rhythm." — \*4) Like Note \*2). — \*5) This descending 6th step has to appear in its *raised* form (contrary to par. 279), because the 7th step was not altered. See par. 400c, of which this is a good illustration; observe that the "prevailing scale" on this beat is that of *G* major, — that is, it is the "*G*-major chord," as V of *c*.

416. The neighboring-note is such a simple factor of embellishment, and its application is so comprehensive and easy, that it may even be employed in *ornamenting certain inharmonic tones*, — when the latter are obviously legitimate, and *sufficiently prominent* to carry the embellishment without losing their identity. This is frequently applied to an organ-point. For example:

1. *Allegro* BEETHOVEN 2. *Allegro*

Ex. 330.

Tonic org-pt. Dom. org-pt.\*

MENDELSSOHN 3.

etc. \*2)

4. *Allegro* MOZART 5. *Andante* MEND. 6. *Allegro* CLEMENTI

S. S. \*2) \*3) \*4) etc.

c V I D B I

7. *Allegro molto* CHOPIN 8. *Presto*

\*5) = etc. \*6)

Db I C I

\*1) An embellished tonic org-pt. The upper neighbor is, curiously, a half-step (representing the lowered 2nd step of the scale). — \*2) An embellished suspension. — \*3) The upper neighbor is embellished (very quickly) with *its* upper neighbor. — \*4) Embellished diatonic passing-notes. — \*5) Like Note \*3). — \*6) Embellished chromatic passing-notes.

See also: **Beethoven**, Sonata op. 14, No. 2, 1st movement, measures 15 and 17; Sonata op. 101, last 15 measures. — **Mendelssohn**, S. w. W. No. 35, Introduction (tenor); No. 45, last 12 measures (org-pt. in bass). — **Schumann**, Symphony No. 3, third movement, measures 11-5 from the end. — **Beethoven**, Symphony No. 4, 3rd mov't, Trio, measures 50-59.

417. Under normal conditions, a neighboring-note is brief, — not longer than the tone it embellishes. Sometimes, however, unusual prominence (length) is given to the inharmonic tone. This is extremely effective, and safe as long as the chord remains unchanged. Thus:

1. *Allegro* BEETHOVEN

EX. 331.

2. *Allegro* CHOPIN. Op. 22 3. *Allegro*

and SCHUMANN. Op. 6, No. 1 4. DEBUSSY 5. *Allegro* C. FRANCK

\*1) These neighb.-notes are accented, and much heavier than their prin. tones. — \*2) The dim.-seventh of *E<sub>b</sub>* major (*d-f-ab-cb*), with proportionately heavier appoggiaturas on each 8th-note. — \*3) A long, heavy passing-note between *f* and *d*. — \*4) A similar heavy neighb.-note of *a*.

See Beethoven, op. 120, Variation No. 1 (bass). — Quartet op. 18, No. 2, last 8 measures of the "Trio" (3rd mov't), in the bass. — Also, op. 120, Variations 12, 28 (neighboring-chords), 8, 9, 27. — Also Ex. 350b.

418. Passing-notes, and also neighboring-notes, may be repeated. For example:

1. *Allegro* CHOPIN 2. *Presto* CHOPIN

EX. 332.

3. *Agitato* CHOPIN

etc.

a I ————— 7# II<sub>2</sub> ————— 7(9) V

419. The most unique effects are produced by *intercepting, or deferring the resolution* of a neighboring-note or passing-note, similar to previous examples (Ex. 156, Ex. 296, Ex. 326). Usually only *harmonic* intervals intervene, but it is even possible to interpose other inharmonic tones; and the resolution may be deferred as long as it is possible to retain the correct chord-impression firmly. For example:

1. BACH 2. *Allegro molto* CHOPIN

Ex. 333.

\*1) \*2)

A V ————— Eb I

3. *Allegretto* ED. SCHÜTT 4. *Allegro* SAINT-SAËNS

etc. \*3)

Eb I ————— E II ————— II ————— V ————— I

5. 6. CHOPIN 7. *Moderato* b.

\*4) etc. \*5)

Bb V ————— Gb V ————— Gb I

Comp. Ex. 262-4.

Use four chords in each measure, in uniform quarter-notes. The 3rd note of each group may be a passing-note, or may be harmonic; but in either case the *chord* must change. See Ex. 329, No. 3.

B. Original phrases, with application of the various licences given above.

THE HARMONIZING OF EMBELLISHED MELODIES AND BASSES.

420. When a florid (embellished) melody is to be harmonized, it is first necessary to reduce it to its original simple harmonic tones by setting aside all such brief ornamental tones as are certainly, or apparently, unessential notes. The melodic outline thus obtained may then be harmonized more or less simply, according to the character and tempo of the melody. The more animated and ornate the melody is, the more smooth and *quiet* should its harmonic accompaniment be.

421. In reducing a florid melody to its simplest elements, the following points must be borne in mind:

- a. Every note which *progresses with a skip* is almost certain to be harmonic. (See par. 405a; but comp. Ex. 296, Ex. 309, Ex. 325, Ex. 328.)
- b. Notes with *accidentals* will be inharmonic, excepting when they are unmistakable indications of a *legitimate and natural* modulation.
- c. The *longer* notes are likely to be harmonic.
- d. The natural order (and rhythm) of the chords, and the fundamental principles of modulation, define the nature of most of the notes, especially those which occupy *accented* beats.

The following melody, for example:

reduced according to these principles, becomes as in Ex. 335.

422. The *tempo* of the melody is a consideration of such moment, that it will usually precede all others in defining the *order* and *rhythm* of the accompanying chords.

For the more rapidly a melody moves, the more emb.-tones it is naturally likely to embrace, and *vice versa*. Comp. par. 169. The foregoing melody would be harmonized about as follows, in different grades of tempo:

- a.  $\tau$  I — V — VI — V  $\tau$  I<sub>1</sub> —  $\overset{7}{V}_2$  — I — V I
- b. I I<sub>1</sub> — I II<sub>1</sub> —  $\overset{7}{V}_3$  I<sub>1</sub> — G<sub>0</sub>  $\overset{7}{V}_1$  I C V I<sub>1</sub> — VI II — V I — I<sub>2</sub>  $\overset{7}{V}$  I
- c. I I<sub>2</sub> I<sub>1</sub> I I<sub>2</sub> V  $\overset{7}{V}$  VI IV<sub>1</sub> G<sub>0</sub>  $\overset{7}{V}_1$  I C  $\overset{9b}{V}_2$  I<sub>1</sub> d  $\overset{7}{V}_1$  V I C  $\overset{7}{V}_1$  V I I<sub>1</sub> I<sub>2</sub>  $\overset{7}{V}$  I

- At a. *Allegro vivace*, an average of one chord to 2 or 3 beats of the melody;
- at b. *Allegretto*, one chord to 1 or 2 beats of the melody;
- at c. *Andante*, one chord to each beat, on an average.

And finally, if the tempo were *Largo* or *Adagio*, the original melody would not be regarded as "florid" at all, but each single tone, as *essential* constituent of the harmony, would demand its own chord.

423. Florid basses are easier to reduce to their simple harmonic groundwork than florid melodies, because their construction is generally more regular, the *accented* notes are almost invariably *harmonic*, and they suggest their harmony more than melodies do. See Ex. 196B.

## EXERCISE SEVENTY.

## A. Florid melodies.

a. *Maestoso*b. *Allegretto*c. *Allegro moderato*d. *Allegro* \*5)e. 1. *Andante*; 2. *Allegro*; 3. *Adagio*

- \*1) The first four melodies are supplied with slurs which indicate the rhythm of the harmony (lower parts).—
- \*2) May be a neighboring-note. — \*3) Suspensions. — \*4) The predominating tone in a group is the *principal tone*. —
- \*5) In melodies of this kind, with rapid figures and large compass, the three lower parts may be written *together* on the lower staff. And the volume of tones may be altered at will, to represent fewer or more than four parts. See par. 462. —
- \*6) To be harmonized in each of the 3 given grades of tempo, according to par. 422.

B. Florid basses.

a. 1. *Allegro*; 2. *Andante cantabile* \*7)

b. *Vivace*

c. *Moderato*

d. *Allegro moderato*

e. *Allegretto*

*f. Allegro maestoso*

*g. 1. Larghetto; 2. Allegro molto*

SEYERLEN

\*7) Like Note \*6). — \*8) In all of these basses, excepting perhaps *f*, the three upper parts may be placed together on the upper staff. See Note \*5). It is chiefly important, as usual, to obtain a good *soprano melody*. This may be defined completely, before the inner parts are added. Fix the principal melody-notes at first approximately (from accent to accent) with general regard to the harmony and modulations, and, as a rule, in *contrary direction* from the bass. All slurs may be ignored, or modified. — \*9) Note \*4). — \*10) Tones which skip are probably *harmonic*. — \*11) Sequences should be treated as uniformly as possible.

#### WANDERING HARMONIES. MODULATIONS WITH INHARMONIC TONES.

**424.** There is still another principle of chord-succession, more widely removed from the fundamental diatonic law (par. 259) and more comprehensive than any heretofore considered; it emanates from the principle of chromatic changes (par. 323), of pivotal modulations (par. 346), and also involves the use of inharmonic tones more or less extensively."

The ruling condition for these "wandering harmonies," — as far as it is possible to systematize so elusive a process, — seems to be: *That any change which results from either a whole-step or half-step progression in any or all of the parts, is permissible* (as long as it preserves a reasonable degree of consonance), by virtue of the relation of propinquity.

**425.** The rules may be formulated about as follows:

1. Some *chord-form*, — it matters little which, or what its tonal significance may be, — should be distinctly recognizable on each accent, or important beat. The more nearly these chord-forms conform to the *natural* succession of chords, the better. Comp. rule 5, below.

2. Wide skips should be almost entirely avoided; *every* part (excepting perhaps the bass) should move conjunctly, either in whole-step or half-step progressions.

3. A direct melodic line (either continuously downward, or upward, or sequential) should be followed in bass or in soprano. The tones may represent any time-values (rhythm), and be harmonic or not.

4. The more urgent active tones should be scrupulously resolved, excepting in chromatic progressions.

5. A fairly frequent movement (resolution) of V into I, and other normal progressions, should be distinctly felt.

6. Every tone should be analyzable according to the logically developed system of tone-relations and obligations. A passage which wholly evades rational analysis cannot endure.

\*1) Observe the uniform soprano figure, and the chromatically descending bass. — \*2) It is probable that this *eb* should be written *d $\sharp$* . That would simplify the analysis. The student will often encounter similar cases of uncertain notation, and must remember that if the analysis of a passage is quite baffling, it may be because the composer wrote hastily, with transient disregard of the true notation. In such cases, the student may test the result by altering the notation judiciously. Comp. par. 285. — \*3) The "chord-form" on this 3rd beat is obvious, but its "name" is doubtful.

\*4) Almost all legitimate chords. Observe the bass-line. — \*5) Or, with *ab* in alto (for five beats, — then *g $\sharp$* ): C II — *a* III. Comp. Note \*2). — \*6) Note the pivotal tones. — \*7) Continuous chromatic line in soprano. — \*8) The *f*, which is the mediant of the first key, becomes an upper neighbor (or suspension) of *e*. At the same time, the former tonic becomes a leading-tone. — \*9) Similarly, the mediant, *f $\sharp$* , becomes an upper neighbor; and tonic becomes leading-tone. — \*10) This tone-body is almost identical with the first chord, — but the 9th (*c $\sharp$* ) has become an upper neighbor, with fine effect. — \*11) Similarly, the 9th (*g $\flat$* ) becomes the upper neighbor of *f*. — \*12) Observe the sequences in both outer parts. — \*13) The tones *a $\sharp$*  and *c $\sharp$*  have precisely the effect of lower neighbors of the chord-tones before and after. — \*14) This bass constitutes the descending minor form (lowered 7th and 6th steps, — par. 272f) of *F $\sharp$*  major. The upper parts adjust themselves smoothly, though rather grotesquely, to it. — \*15) In the violin-part, a scale in successive whole steps. The first five tones follow the lingering impression of the preceding key; the rest follow the track of *f* minor. The second measure is a sequence, harmonically identical with the first. — \*16) The *b* in soprano is a pivotal tone, first as 3rd, then as 5th, 7th,

and finally 9th. Note the sequences in bass. — \*17) Note the pivotal tones. — \*18) Note the soprano line. — \*19) A fine illustration of wandering harmony; it baffles exact chord-analysis, but is *smooth* and wholly plausible.

See also Grieg, Ballade, op. 24, Theme (note the descending bass); and Nocturne, op. 54, No. 4, measures 5-14; 49-54 (consecutive dom.-7ths).

WARNING NOTE.

426. These extraordinary examples have been incorporated in the book because the author believes that it would be unscientific to disregard them. But the student is earnestly reminded that such combinations contribute to the *interest only*, — not to the durability, — of a composition; and that they serve an important purpose only when used in great moderation. The student should thoroughly absorb the following esthetic principles:

On the one hand, — *avoid too great simplicity, too great regularity, monotony, and lack of ingenuity;*

On the other hand, — *avoid extravagance, lawlessness, eccentricity, and grotesqueness.*

In a word, — **cultivate moderation** in every respect. An occasional unique effect is very valuable and necessary; but the value of any object is increased by its rarity; — abundance deprives it of its value, makes it “cheap.” The unconquerable power of the music of **Beethoven** (also of **Mozart**, **Bach**, **Brahms**, **Schubert**, and other classic masters) lies in the *moderation* he constantly exercises; in the unwavering loyalty to the **natural laws** of tone-association, the normal conditions and relations of chord-movement, properly blended with an occasional irregularity that matches the most consummate ingenuity of any modern writer. Cultivate moderation; all defect lies in exaggeration.

EXERCISE SEVENTY-ONE.

The student may experiment with the above material, in **Original phrases** and periods. Or he may, perhaps more wisely, defer this exercise until he shall engage in the study of Counterpoint.

ANALYSIS.

427. In conclusion, the student is recommended to analyze the following compositions from time to time during the study of Part V, in the given order, defining the chords, the modulations, and all inharmonic intervals. Ex. 337 will serve as a model, though more knotty passages than these will rarely be found. **Always consider the tempo, and direct the attention constantly forward** to the following chord or two.

**Mendelssohn:** Songs w. Words, Nos. 15; 12; 30; 6; 48; 41; 28; 35; 27; 11; 40.

**Cramer:** Études, Nos. 75; 84.

**Mozart:** Sonata in D major (Schirmer edition, No. 14), complete.

**Beethoven:** Sonata op. 14, No. 2, 1st mov't; op. 27, No. 1, 1st and last movements.

**Schubert:** Sonata No. 8 (C minor), 1st mov't; No. 5, op. 143, complete.

**Mendelssohn:** *Scherzo a capriccio* in F# minor.

**Bach:** Well-tempered Clavichord, Preludes (Book II) 12; 16; 19; and Fugues (Book I) 5; (Book II) 7; 21.

**Chopin:** Nocturne, op. 37, No. 2; Preludes op. 28, Nos. 7; 9; 17; (14), and others.

**Beethoven:** Variations op. 120, complete; Sonata op. 101, complete.

**Schumann:** op. 15, complete. “Humoreske” op. 20, complete.

**Wagner:** “Lohengrin,” Introduction to Acts I and III. Also portions of “Tristan und Isolde.”

**Brahms:** Piano-pieces, op. 76, Nos. 7; 6; 4; 1; 2; 3. Op. 116, Nos. 2; 5; 6. Op. 119 complete.

## PART V.

### VOCAL AND INSTRUMENTAL HARMONY WITH AN IRREGULAR NUMBER OF PARTS (FEWER OR MORE THAN FOUR).—STYLE.

#### SECTION I. VOCAL HARMONY.

**428.** The general distinction between vocal and instrumental harmony is, that the former is the more strict, more quiet, and more limited in compass. In vocal music there is a definite number of "voices" or tone-lines, which are adhered to, and are treated with more equal consideration than instrumental "parts," which often sacrifice their individuality, partly or completely, in the variable volume of tone.

#### THREE-PART HARMONY.

**429.** When the number of parts is decreased from four to three (or even to two), the omission of certain chord-intervals is unavoidable, and duplications are less common than in regular four-part harmony.

**430.** The rules for 3-part harmony are as follows:

*a.* In *triads*, the fifth may be freely omitted, and the root doubled. Or the root may occasionally be omitted, and the fifth or third doubled. The chord-third, on the contrary, *should not be omitted* — in triads.

*b.* In *chords of the seventh*, the fifth is more generally omitted than the third, though much depends upon the quality of the chord. The root may occasionally be doubled, and both third and fifth omitted.

*c.* In *chords of the ninth* (which are naturally rare), third and fifth, or root and fifth are to be omitted. No intervals are doubled. Thus:

Soprano, alto and tenor

Ex. 338.

\*<sub>1</sub>) See par. 58. It is possible to lead adjacent voices more than an octave apart, but wise to avoid it, — especially in the two upper parts.

**431.** *a.* The perfect cadence may consist of the open tonic octave (I, with third and fifth omitted); or the I<sub>1</sub> may be substituted for the I itself. But in the latter case the fifth is generally omitted and the root doubled, in order to impart greater emphasis to the tonic note.

*b.* An inversion may also be substituted for the V or  $\overset{7}{V}$  at the cadence; and the lower parts may *cross*, if the cadence can thereby be made smoother or stronger. Thus:

Two sopranos and alto

Ex. 339.

See the Terzet for female voices in "Elijah"; and Ex. 227-1 (tenor, alto, soprano).

## EXERCISE SEVENTY-TWO.

A. Exercise 31, basses *a, c, d, f* (and the others, at option) are to be transposed a *fifth higher*, and set for tenor, alto and soprano. The given bass figuring may be retained, or the pupil may treat the basses as *unfigured*, and choose his own chords and modulations. First *complete the soprano melody* (regardless of the given positions) and add the inner part last.

B. Any of the melodies given in Exercises 16, 17, 22, 27, 32, 36, and 55, — to be set for soprano, alto and tenor. No regard need be paid to the given slurs. The student is advised to use a *separate staff for each part*, as in Ex. 340.

C. The melodies of Exercises 16, 17 and 22 are to be transposed an *octave lower* (or a little less, according to circumstances), and used as *alto part*, accompanied by one upper and one lower part. For example:

Ex. 340.

The musical score for Exercise 340 consists of three staves: Soprano, Alto, and Tenor. The key signature is one flat (B-flat) and the time signature is 6/8. The Soprano staff begins with a melody that includes notes marked with asterisks and subscripts: \*2) and \*4). The Alto staff begins with a melody that includes notes marked with asterisks and subscripts: \*1) and \*2). The Tenor staff begins with a melody that includes a note marked with an asterisk and subscript: \*3). The music is written in a style typical of 19th-century pedagogical texts, with clear note heads and stems.

\*1) Given melody, Exercise 22, *g*. — \*2) Ex. 338, Note \*1). — \*3) The lower parts may occasionally cross. — \*4) *Passing-notes* may be used at discretion, but according to the rules of rhythm; *i.e.*, chiefly on unaccented beats. And perfect freedom may be exercised in modulating.

## TWO-PART HARMONY.

**432.** Two-part harmony is, properly speaking, no more than a succession of *intervals*; for the fundamental succession of *chords*, when expressed by two parts alone, is necessarily vague. Nevertheless, even *two* parts must coöperate in obedience to the laws of harmonic progression as far as their application is possible; and, for this reason, the only absolutely unquestionable intervals are the *3rds* (or *10ths*) and their inversions, the *6ths*, — the fundamental intervals of chord-formation. A distinction is made between the *full* beats and the *fractions* of beats, as follows:

**433. Rules for full beats.**

*a.* A *third* (or *tenth*) or a *sixth* can be used without any other limitation than that indicated in par. 435*a*, upon full beats, accented or unaccented, and in any duration. Whether the 3rd or the 6th be chosen, depends upon the chord it evidently represents, and upon the melodic tendency of the parts.

*b.* The *octave* is admissible.

*c.* A *perfect fifth* represents a triad with omitted third, and is therefore to be avoided. It is allowed, exceptionally, *in the V*. The *perfect fourth* represents a 6-4 chord without its third, and is strictly prohibited. The *diminished fifth* and *augmented fourth* represent the  $\overset{7}{V}_0$  with omitted fifth, and are therefore admissible.

*d.* The *minor seventh* (or *major second*) is allowed, but the quality of the chord which it represents must be considered. *Major sevenths* (or *minor seconds*) are to be avoided. The *diminished seventh* (*augmented second*) is allowed. See also paragraph 42. For illustration:

Ex. 341.

**434. Rules for fractions of beats.**

a. Upon fractions (accented or unaccented) of beats **any interval** may be used, either as harmonic combination, or as suspension, neighb.-note or passing-note.

b. All exceptional intervals (7th, 2nd, 9th, 4th, 5th) must appear as modifications of the unobjectionable 3rd, 6th or 8th. Thus:

Ex. 342.

**435. a.** Intervals of the third or sixth should not occur too often in direct succession; as a rule, not more than three (or four) times.

b. It is objectionable to use weak or harsh intervals in succession.

c. The part-progressions must be as *melodious* as possible.

d. The rules of rhythm must be strictly regarded. Ex. 340, Note \*4). For example:

Ex. 343.

The rules of two-part harmony, as here enunciated, are the essence of the laws of two-part *counterpoint*.

EXERCISE SEVENTY-THREE.

A. A number of melodies from former exercises are to be supplied with an accompanying alto part, according to the above rules. It is not necessary that the added part should have the same rhythm as the given part; on the contrary, diversity of rhythm is very desirable. But see par. 435d, and be careful that the heavier notes occupy *accented* beats. The utmost freedom in modulating is allowed.

B. The same, or other, melodies, to be transferred an octave *lower*, as *alto* (or *tenor*) *part*, and supplied with an accompanying *soprano*. For example:

a. (Exercise 36, a.)

Ex. 344.

b. (Exercise 22, i.)

(Given melody)

### FIVE- TO EIGHT-PART HARMONY.

**436.** When five, six, seven or eight parts are employed, it is important to keep the parts well balanced, in regard to their *distance* from each other, and in regard to the *duplication* of the chord-intervals. It is particularly unfavorable in copious harmony when the lower parts lie too close together; but even the upper parts should avoid too close proximity. For instance:

Ex. 345.

### 437. Hints and directions.

- a. The inner parts may cross without scruple. But an *inner* part should not cross either the *soprano* or *bass*.
- b. Almost any tone may be doubled; but only the principal tones should be tripled.
- c. Interrupted 8ves and 5ths, and unequal 8ves, are allowed *between any but the two outermost parts*.
- d. The two or three lowermost parts must be kept wider apart than the higher ones (excepting when any two adjacent parts have the same tone *in unison*), as small intervals sound dense in the low register. Ex. 345, measure 3.
- e. Wide skips are often unavoidable, particularly where the parts cross and re-cross; but awkward leaps should be avoided.
- f. When a larger number of parts are employed, chords of the seventh should be freely used, as they afford more tone-material than simple three-tone chords. See also Ex. 169, measures 3 to 5.
- g. The harmonic progressions should be very simple. The difficulty of connecting certain chords in four-part harmony is greatly increased with each additional part. This applies particularly to foreign chord-progressions, and chromatic successions. The combination of related chords, and especially repetitions, give but little trouble.

**438. a.** In *five-part* harmony (the usual four voices with an additional soprano or mezzo soprano, or tenor), sensitive tones need not be doubled. The principal tones of the scale and chord are generally *tripled*.

See Mendelssohn, "St. Paul," Choruses Nos. 23 and 36. — Bach, *B-minor* Mass, Choruses Nos. 1, 4, 11, 12, 15, etc.

**b.** In *six-part* harmony (doubled soprano and tenor) the principal tones of the scale are tripled, as a rule, and the next best interval of the chord doubled. But, as strict observance of this rule would needlessly enhance the difficulties which attend the manipulation of a large number of distinct parts, it must be applied only as a general principle.

See Bach, *B-minor* Mass, Chorus No. 20.

**c.** *Seven-part* harmony is comparatively rare in vocal music. The original four parts are usually doubled, as in eight-part harmony, with the exception of the alto or bass.

See Händel, "Alexander's Feast," Chorus No. 6. — Beethoven, "Fidelio," Act I, Finale, Chorus of prisoners (also eight-part).

d. In eight-part harmony (each of the four original parts doubled) every licence, in reference to the duplication of sensitive tones, and irregular part-progressions, may be freely employed.

See Bach, B-minor Mass, Chorus No. 21. And the following illustration (German chorale):

EX. 346.

SOPR. I *Adagio*

SOPR. II

ALTO I

ALTO II

TENOR I

TENOR II

BASS I

BASS II

Other examples of Six, Seven and Eight-part choruses may be found in Händel's "Israel in Egypt" (e.g., Nos. 12, 13, 16, 19, 23, 25, etc.).

EXERCISE SEVENTY-FOUR.

a. *Adagio* For 5 parts \*1) \*2)

German Chorale

b. *Adagio* 6 parts \*3)

German Chorale (WALTHER)

c. *Adagio* 7 and 8 parts \*4)

"Old Hundredth"

\*1) To be harmonized twice; at first with *two tenors*, and then with *two sopranos*. Three staves are to be used (similar to Ex. 340). — \*2) The end of each line, marked  $\curvearrowright$ , must be a substantial *triad*. — \*3) In this chorale four staves must be used, as in Ex. 346. — \*4) Seven-part harmony (one bass part, instead of two) during the first line ( $4\frac{1}{2}$  measures); and then 8-part harmony to the end. — Besides these melodies, the chorales in Exercise 68 (2, 3 and 4) and some of the basses of Exercises 7, 9, 10, 20, 29, 33, and others, may also be set for 5 to 8 parts.

## SECTION 2. INSTRUMENTAL HARMONY.

## FIGURATION OR BROKEN CHORDS. ACCOMPANIMENTS.

439. Instrumental music possesses many advantages over vocal music, the most striking of which are a more extended *compass*, greater facility of *technique*, and the possibility of producing *simultaneous* tones upon many of the single instruments.

The instrument which is probably most familiar and most accessible to the student, and which is best suited to the purpose of this Section, is the *pianoforte*. Therefore, that instrument is adopted as the basis of the following exercises.

440. When the intervals of a chord *appear successively in the same part*, instead of *simultaneously in different parts* (as heretofore), the chord is "broken" or "dissolved."

441. The succession of the different chord-intervals constitutes a melodic **figure** or **motive**; hence, the term "**figuration**" is applied to a harmonic progression in which the chords are broken according to an adopted motive, — as accompaniment.

442. A chord may be thus dispersed, or broken, for three reasons:

- (1) For the melody-line itself, as seen in Ex. 18;
- (2) For the accompaniment, — the principal reason; or
- (3) For the rhythm (Ex. 364). See **Mendelssohn**, Song w. Words No. 15, last 5 measures, where all three purposes are effected (the rhythm in bass).

443. There are three distinct species of figuration, namely:

**Harmonic figuration** (consisting exclusively of chord-intervals);

**Melodic, or mixed, figuration** (in which inharmonic tones are interspersed); and

**Rhythmic figuration** (in which the tones or chords are simply reiterated).

## HARMONIC FIGURATION.

444. The simplest kind of harmonic figuration is based upon regular four-part harmony. The notes of two, or three (or of all four) adjacent parts appear successively, in such order as the adopted motive dictates, but usually so that the most important harmonic interval (usually a 3rd or 6th) falls upon the accented beats.

For illustration:

Ex. 347.

1. 4-part      2. 3-part      3.

\*1)      \*2)      or \*8)      (\*4)      \*5)      or \*6)      etc.

4.      (?)      5. 2-part      6. 1-part

\*7)      (\*4)      or      etc.      \*8)      or      or      or      \*9)      or      etc.

\*1) The original, unbroken, harmonic succession. — \*2) The notes of the original alto and tenor appear *successively*, creating one "figural part," instead of two melodic parts. — \*3) Here as ascending figure. — \*4) The open 5th is a little meagre, but not wrong. — \*5) The original bass and tenor, ascending. — \*6) The same, descending. This is somewhat irregular, as the original bass tones may need to be heard in their proper places, on the beat. — \*7) Soprano and alto merged in one figural part. — \*8) The three lower parts merged in a figural part. — \*9) All four parts merged.

445. All larger (longer) figures, or "figural motives," grow out of the simple figures that were derived thus from the original 4-part harmony, by the following means: (1) by rests; (2) by repetitions; (3) by extension into a higher or lower octave; (4) by adding inharmonic tones (as *melodic figuration*, — see par. 458). Thus:

Ex. 348.

The musical notation for Ex. 348 is presented in two systems. The first system shows a piano accompaniment with a treble and bass clef. Above the staff, four specific transformations are labeled: \*1) (original), \*2) (rest substitution), \*3) (ascending figure), and \*4) (lower octave extension). The second system shows a more complex figural part with a treble clef, labeled \*5) and a question mark, illustrating the merging of parts.

\*1) The simple motive from Ex. 347, No. 2. — \*2) A rest is substituted for the first stroke. — \*3) The first tone recurs as third stroke. — \*4) The lower octave of the original alto note is preposed. The bass is lowered, to make room for the extension. — \*5) It is better not to let the figural part overlap the outer parts.

THE REGISTERS OF THE FIGURAL PART.

446. The figural part occupies perhaps most commonly the **middle (or inner) register**, embracing a part, or, if necessary, all of the harmonic intervals *lying between the original melody and its bass*. Thus:

Ex. 349.

The musical notation for Ex. 349 is in G major (one sharp) and common time. It shows three parts: 'Melody' (top staff), 'Figural part' (middle staff), and 'Bass' (bottom staff). The 'Figural part' is specifically labeled as 'Motive' and 'etc.'. The title 'MENDELSSOHN. S. W. W. No. 1' is written above the melody staff.

See also Mendelssohn, Songs without Words:

- No. 15 \*1) (figural motive of 6 notes);
- No. 19 (figural motive of 5 notes preceded by a rest);
- No. 21 (figural motive of 10 notes and a rest; peculiar rhythm);
- No. 30 (figural motive of 3 or 4 notes; arpeggiated chords).

Beethoven, Sonata op. 13, Adagio, measures 1-8 (figural motive of two notes, repeated).

\*1) Where the melody proper begins (meas. 7); and the same in the other examples.

447. a. But the figural part may also occupy the **lower register**, embracing the bass.

b. Or it may occupy the **upper register**, embracing the original melody.

c. Or it may occupy the **uppermost register**, as **accompaniment**, independent of the melody.

The latter, in this case, will appear in an inner part, or, more rarely, in bass. For illustration:

Ex. 350.

a. *Andante* MENDELSSOHN. No. 2

b. *Allegro* MENDELSSOHN. No. 34

BRAHMS

c. *Presto* MENDELSSOHN. No. 34

d. *Allegro* MENDELSSOHN. No. 3

\*1) 447a. — \*2) 447b. The added downward stems merely serve to mark the original melody, and do not constitute a separate part. The figural part *embraces* the melody. — \*3) 447c. The melody lies in tenor, and, in playing, must be made prominent by accentuation.

See also: Mendelssohn, S. w. W. No. 18, measures 6-9, 14-17, etc.; No. 5, measures 19-22, 58-66.

Cramer, Études, Nos. 3, 9, 12, 74, 55, 51 (original *complete* edition).

Beethoven, Sonata op. 53, 1st mov't, measures 42-49.

Chopin, Prelude op. 28, No. 3; Nocturne op. 72, No. 1.

448. The figuration may, furthermore, be **transferred from one register to another**. This usually takes place at the beginning of a new phrase or section; but is also possible from one melodic member to another, or from measure to measure (or even from beat to beat).

See Mendelssohn, S. w. W. Nos. 2, 5, 40; Prelude op. 35, No. 1.

Cramer, Études, Nos. 15, 38, 79, 52, 53.

Beethoven, op. 120, Var. 6 (26, 27).

## HINTS AND DIRECTIONS.

449. The general requirements of a figural part may be defined as follows: it should *flow smoothly, in regular, uninterrupted rhythm*; it should be *symmetrical*; it must produce a *complete* harmonic impression, and must **sound well**. In detail, the following rules must be observed:

450. The figural motive is defined by the **direction** and **rhythm** in which the intervals succeed each other; not by the **size** of the intervals. The following figures all represent the same motive:

\*1) Any *characteristic* feature which the adopted motive may contain should, however, be retained, — for instance, inharmonic notes, and recurrences.

451. The motive adopted for the figuration at the outset should be **retained** throughout, or during a complete section of the piece, as strictly as the harmony will permit. The following exceptions are allowed, and are very common:

1. The **contrary motion** of the motive may be substituted. Ex. 327, Note \*3).
2. **Fragments** of the motive may be used, instead of the whole, in case the original motive cannot conveniently be made to express the required harmony. This is usually necessary at *shorter* melody-notes, or at more *rapid changes* in the harmony.
3. The motive may be **entirely changed** during any cadence, brief as well as final. It is well to do this, for the *uniformity* of the figure becomes too conspicuous and monotonous at pauses in the melody, and at the cadences.
4. A **rest** may be substituted for the *first* note of the motive, at any point, even if not a feature of the original figure; e.g., ♯ , etc. Comp. par. 405*h*.
5. The motive may be changed upon *altering the register* (par. 448).

N.B. These changes should not affect the *rhythm of the motive*. See par. 454. For example:

Ex. 352.

452. It is unwise to omit the chord-third, or to double sensitive tones *at the accents* or on accented fractions of beats, *although this may be done anywhere else*, especially in rapid tempo. The most sensitive tone is the *leading-tone*, and it is usually necessary to avoid its duplication, excepting on weak fractions of the beat. For illustration:

Ex. 353.

453. Successive 5ths or 8ves are not at all serious between the *figural part* and the melody or bass, as the dispersion of the chord generally conceals them (comp. par. 65b). As a rule, however, they should be avoided in *direct* succession. *Intentional* 8ve-parallels (Ex. 354b) are often extremely effective. For example:

Ex. 354.

b. MENDELSSOHN, op. 54, Var. 11

454. The **rhythm** of the figural part *must not be interrupted or changed at rests, at the cadences, nor in the course of the period.*

455. As a rule, the broken chords (figural groups) should succeed each other just as the *unbroken* chords would. This is chiefly important in the *lower (bass) register*, where the rule of par. 28 is imperative; that is, the figure may continue in one direction *only as far as the chord extends*; when the chord changes, the figure (in bass) should change, at least briefly, its direction (Ex. 355b). For example:

Ex. 355.

**456. The registers.** *a.* When the figuration is in the **middle register**, the outer parts may, if necessary, be transferred to a higher and lower octave, so as to avoid embarrassing the figural part. This may occur during any *complete member* of the melody, — not at *single tones*.

*b.* When the figuration is in the **lower register**, embracing the original bass part, care must be taken to *preserve the effect of the latter*, by using each separate bass tone as *lowest note of its figural group*, and generally, though not necessarily, as *first note* also.

*c.* When the figuration is in the **upper register**, embracing the original melody, each separate tone of the melody *must be distinctly heard as uppermost* (and almost always as *first*) note of its figural group; and their connection with each other as continuous “melody” must be made conspicuous by *isolating* them as much as convenient from the other (lower) tones of the figural motive; thus:

Ex. 356.

*d.* If, on the contrary, the figuration is in the **uppermost register** and does *not* embrace the melody, it must be kept so subordinate in its melodic character that it does not detract from the necessary prominence of the melody proper. See Ex. 350*d*.

**457.** It is important to recollect that whatever movements take place *within* the motive, being probably only “chord-repetition,” are not subject to any other regulation than that of par. 451. The critical moment is, always, where the *chord changes*, *i.e.*, generally from the last tone of one group to the first tone of the next. At this moment the same rules apply, and the same care must be taken, as in ordinary progressions, — especially in bass (par. 455).

EXERCISE SEVENTY-FIVE.

Melodies, with given bass, to be elaborated with *harmonic figuration* as indicated below.

No. I. *Andante*

\*1) This first melody-note is not to be accompanied. — \*2) The *seventh* may be added to the dominant chord, if necessary. In general, *the given bass (harmony) is not insisted upon*. — \*3) Indicates the semicadence. — \*4) The figural part runs on to the 4th beat.

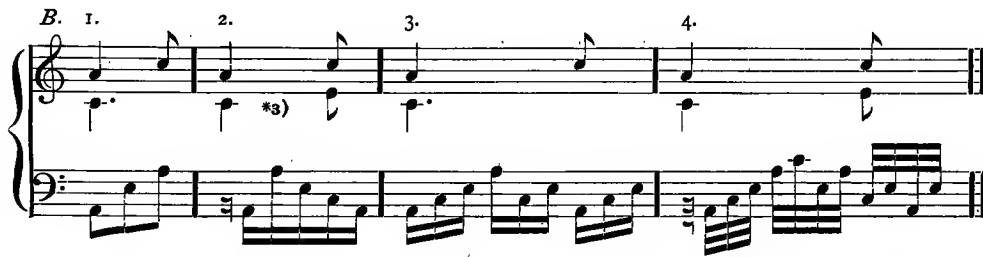

This melody is to be supplied with a figural part (3-part harmony) in the *middle, lower and upper register, in succession*, in rhythms of 1, 2, 3 and 4 notes to a beat (♪, ♪, ♫, ♬) successively, with the following motives (each model to be worked out *complete*):

Ex. 357.

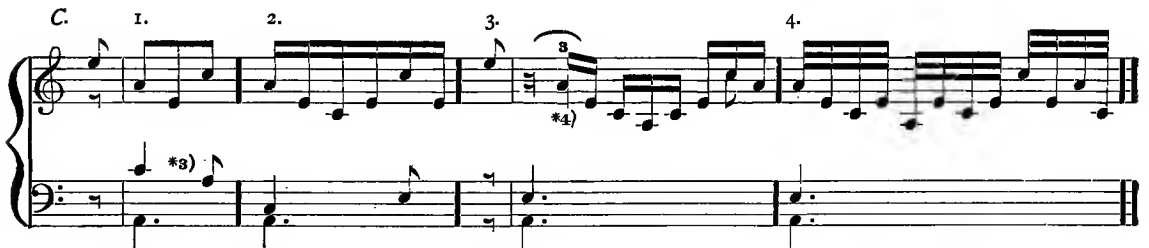

A. 1. 2. 3. 4.

B. 1. 2. 3. 4.

C. 1. 2. 3. 4.

\*1) Contrary motion of the adopted 3-tone motive. — \*2) The motive may embrace *any number of notes*, in the adopted rhythm. — \*3) The object of the inner part is, principally to assist in completing the harmony Its progressions are quite optional, but should be as *quiet* as possible. — \*4) The original melody-notes as highest, but as *second*, note of the figural groups.

No. 2. *Andante cantabile*

\*1) The figural part *must not stop* (par. 454). — \*2) The figural part stops at the second beat.

To be elaborated similar to No. 1, with original motives:

- a. in the middle register (figural rhythm either 8ths, 8th-triplets, 16ths, or 16th-sextolets).
- b. in the lower register, rhythm of 2, 3, 4 or 6 notes, at option.
- c. in the upper register, rhythm optional.
- d. in *alternating registers* in  $\frac{3}{4}$  notes, transferring the figural part at discretion: say first after 4 measures, then again 4, then 2, and 2, and finally at each single measure.
- e. in the *uppermost register* as accompaniment, the melody in *tenor*, as follows:

Ex. 358.

etc. (Motive of one whole measure.)

No. 3. *Andante*

BEETHOVEN.  $E\flat$  maj. *Concerto*

par. 454

To be elaborated similar to No. 1, in the middle, lower, and upper registers, and in *alternating registers*, in rhythms of 3, and 4, notes to a beat.

No. 4. *Moderato*

I VI I<sub>1</sub> IV 0V<sub>1</sub> V<sub>1</sub> I V V<sub>3</sub> — I<sub>1</sub> IV<sub>1</sub> IV V — V<sub>1</sub> I I D I<sub>1</sub>

D V<sub>3</sub> I<sub>1</sub> I IV 0V<sub>1</sub> I V V<sub>1</sub> V<sub>0</sub> I G IV<sub>1</sub> V V<sub>3</sub> I<sub>1</sub> VI I<sub>1</sub> V V — I

BACH (adapted)

Similar to No. 3, in rhythms of 3, and 4, notes to a beat.

The following simple period:

No. 5. *Moderato*

6 4 5 6 4 5 6 #6 6 6 4 7 7 b6 6 7 6 6 b7 7

or an octave lower

is to be elaborated with harmonic figuration at the piano, at sight, in the following modes, successively:

(Right hand) \*1)

1. 2. 3. 4. 5. 6. 7. 8.

L.H. R.H.

\*1) The left hand retains the given bass.

MELODIC (OR MIXED) FIGURATION.

458. a. Inharmonic notes may be interspersed between the harmonic tones, either *casually*, to facilitate the movement of the figural part, or *essentially*, as a feature of the motive itself.

b. It is most convenient to use *simple neighboring-notes* (local embellishment of any of the principal tones of the original motive). *Passing-notes* are more smooth, and more valuable, but embarrassing, because their use is dependent upon the size of the interval.

Applied to Ex. 347, No. 2, the result might be:

Ex. 359.

See Chopin, Prelude, op. 28, No. 13.

EXERCISE SEVENTY-SIX.

A. Melody No. 1 of Exercise 75, to be elaborated with *melodic figuration* according to the following models:

And finally, two or three times in *alternating registers*, in rhythms of 3 and 4 notes to a beat, with original motives.

B. Melody No. 2 of Exercise 75, to be elaborated successively in the middle, lower and upper registers, and finally in *alternating registers*, in optional rhythms, with original motive, as above.

TWO-PART FIGURATION.

459. In the absence of an inner part, the number of parts is reduced to two. In order to avoid meagre effects, the motives are generally more copious, and more rapid, than in 3-part figuration.

For example:

BEETHOVEN

See also: Mendelssohn, S. w. W. Nos. 11 (measures 1-8), 25, 31, 37; Prelude op. 35, No. 1.

Cramer, Études 21, 24, 27, 31, 46, 62, 77.

Schumann, "Albumblätter," op. 124, Nos. 6 and 16.

Chopin, Prelude op. 28, No. 24; Nocturnes: op. 9, Nos. 1 and 3; op. 27, Nos. 1 and 2; op. 48, No. 2; op. 55, No. 2.

EXERCISE SEVENTY-SEVEN.

A. Melody No. 1 of Exercise 75, to be elaborated as follows:

B. Melody No. 2 of Exercise 75, to be elaborated in different varieties of 2-part figuration, harmonic or melodic at option, in rhythms of (3) 4 and 6 (8) notes to a beat.

C. Melody No. 4 of Exercise 75, to be elaborated in two-part *harmonic* figuration, in either register, and in *alternating* registers, with 4 and 6 notes to a beat.

ONE-PART FIGURATION.

460. Finally, all the parts together may be merged in **one figural part**, embracing the original melody and bass as *highest* and *lowest* notes (but *not necessarily as first notes*) of each group.

The motives are almost always copious and rapid. The figuration is apparently thrown from one register to another uninterruptedly; or it consists of continuous groups, extending throughout the space included between the melody and bass. For example:

CZERNY. Op. 740, No. 6

Ex. 361. *Allegro*

See also No. 18 of this collection of Czerny

See Mendelssohn, Caprice op. 33, No. 1, measures 1-6.  
Cramer, Étude 33.

EXERCISE SEVENTY-EIGHT.

No. 1

S.

To be elaborated with one-part figuration, as follows:

\*1) The characteristic features of these motives must be strictly adhered to.

No. 2. *Allegro*

HANDEL

\*1) Continue in the manner indicated in the first half of the measure. — \*2) The 2nd half of the motive, twice. — \*3) End figural rhythm on 3rd beat. — This exercise may also be made at the piano, with other (original) motives.

No. 3. The 5th melody of Exercise 75 is to be elaborated at the piano, in the following ways:

**461.** On the other hand, the figural part may be accompanied by three or even more harmonic parts; in this case the motive is likely to be shorter and more narrow than in three-part figuration.

See Cramer: *Études* 10, 18, 25, 28, 36, 40, 56, 80, 82.

Mendelssohn: S. w. W. No. 11, second Part (*i.e.*, after the 2nd double-bar); No. 21.

## IRREGULAR PART-WRITING.

**462.** In music that is designed for the keyboard, rather than for a definite number of vocal or instrumental parts, the volume of harmony may be increased or decreased with the utmost freedom, at single points, or during certain members of the phrase.

Such alterations in the volume of harmony should be made with some regard to the principle of tone-lines, and not in such a way as to produce an uneven and formless result. Therefore, when a fundamental part is temporarily omitted, it is usually necessary to introduce rests in its place, especially when the omissions are *brief*. Additions generally result from the octave-duplication of a fundamental part (most commonly the soprano or bass); though the increase in volume

may also occur at single points, as if an inner part had separated into two or more, for the moment. *When the time-values are alike*, any number of notes may be placed upon *one stem*, — never, however, when the time-values differ. For illustration:

Ex. 362.

1. *Allegro vivace* BEETHOVEN

2. *Allegro* BEETHOVEN 3. *Adagio*

4. *Allegretto* MENDELSSOHN

\*1) First one part (line), then three, then two, — finally five. Note the manner in which the notes of equal time-values are stemmed together. — \*2) First five, then three, then four, three, and again four, parts. — \*3) The bass is duplicated in the upper octave, almost throughout. — \*4) Here the soprano is duplicated. — \*5) Increase of volume to seven parts. — \*6) Decrease of volume from four (and five) to one part. Note the rests.

See also: **Bach**, Well-tempered Clavichord, Book I, Prelude 22 (*b* minor).

**Mendelssohn**, Songs w. Words, No. 2, measures 2, 3; No. 11, measures 1, 9, 10, 12, 16, 17, 20, etc.

In **Beethoven**, Sonata op. 14, No. 2, *Andante*, on the contrary, the fundamental four parts are retained throughout the Theme, with but few additions or reductions.

#### FIGURAL MOTIVES WITH SUPPLEMENTARY TONES.

**463. a.** Upon this same principle figural motives may be made, in which certain intervals are furnished with one or more harmonic supplementary tones (or twin-notes, as they might be called).

**b.** The twin-notes should occur as a rule at the *corresponding place* in each group. Still, unique effects are sometimes produced by an irregular disposition of the supplementary tones. For illustration:

Ex. 363.

\*1) The twin-notes occupy *different* places in the groups. In Nos. 1 and 2 they are regular.

See Mendelssohn, S. w. W. Nos. 6, 12, 13, 29.

Cramer, Études 17, 58, 60, 76, 78.

Chopin, Ballade op. 38, 2nd section; Nocturnes: op. 9, No. 2; op. 15, Nos. 2 and 3; op. 32, No. 2; and op. 48, No. 1; Études op. 25, Nos. 3, 4, 5 (especially the middle section), 9.

Beethoven, Sonata op. 2, No. 3, last movement, measures 29, etc.

Henselt, Études op. 5, No. 2, No. 10 (middle section).

#### EXERCISE SEVENTY-NINE.

A. Melody No. 3 of Exercise 75, to be elaborated with the following motives:

B. Melody No. 4 of Exercise 75, to be elaborated with the following motives:

To this the pupil may add an elaboration with original motives, in *alternating registers*.

#### RHYTHMIC FIGURATION.

**464.** When the figural motive consists entirely, or in part, of *repeated notes*, the figuration may be termed **rhythmic**, in distinction to pure harmonic, or melodic figuration. In such cases, the casual (or constant) enlargement of the motive by means of supplementary notes is more natural and necessary than in the other species of figuration. For example:

1. *Andantino* MOZART 2. *Allegro*

Ex. 364.

CHOPIN 3. *Allegro* MENDELSSOHN

\*1) Rhythmic figuration is very frequently *syncopated*, as here.

See also: **Mendelssohn**, S. w. W. Nos. 10, 14, 20, 26, 39, 8, 22, 27, 33, 24, 36. — Op. 54, Var. 12. — Op. 82, Var. 3.

**Cramer**, Étude 52.

**Chopin**, Nocturne op. 15, No. 1; Preludes, op. 28, Nos. 17 and 15.

**Beethoven**, Sonata op. 22, second mov't; op. 7, first four measures; op. 14, No. 1, first mov't, last 15 meas.

**465.** The reason for designating this species "rhythmic" figuration is very plain. Not the chords themselves, but the "rhythm" is broken. The "motives" in rhythmic figuration (if they may be so called), are all exactly or nearly alike in form. The difference lies in the *effect* the various styles produce, and this depends solely upon the rapidity of the reiterations, *i.e.*, upon the *tempo* of the rhythmic figure. Compare, for instance, **Mendelssohn's** Song without Words No. 10, with No. 22.

With what striking effect rhythmic figuration *in slow tempo* may be used (especially in the low registers) will be seen in **Bach**, St. Matthew Passion, Edition Schirmer, pages 44, 53, 128 etc., — in each instance the bass part; page 195, upper part. — Well-tempered Clavichord, Book I, Preludes 8, 22; Book II, Prelude 3. — **Brahms**, 1st Symphony (*c minor*), Introduction to 1st movement (bass).

*In rapid tempo*: **Rubinstein**, Étude, op. 23, No. 2; **Wagner**, "Flying Dutchman," closing Chorus in No. 4 (2nd Act).

*In moderate tempo*: **Beethoven**, 8th Sym., *Allegretto scherzando*.

EXERCISE EIGHTY.

Elaborate the following models at the piano:

Exercise 75, No. 1. Exercise 75, No. 5

Exercise 78, No. 1

## DOUBLE, COMPOUND AND COMPLEX FIGURATION.

**466.** In **double figuration** there are **two figural parts** (usually representing adjacent voices, but sometimes separated by one or more harmonic parts), which operate in concert throughout the whole, or certain sections of the piece, and employ the *same* motive, or *different* motives. This mode of employing simultaneous figural parts must not be confounded with *alternating* registers, which it may sometimes resemble in effect, but from which it always essentially differs.

**467.** The distinction between double, compound, and complex Figuration is as follows:

**Double**, when the melody and rhythm of the figural motives are alike, the figural parts generally running parallel, as simple duplication in 3rds or 6ths (along the chord-line);

**Compound**, when the rhythm of the motives is the same, but the *melody different*;

**Complex**, when the *rhythms are different*. For example:

Ex. 365.

1. *Double* MENDELSSOHN. No. 7

2. *Compound* CRAMER

3. *Complex* MENDELSSOHN. Op. 44, No. 2

Of these three varieties of duplicated figuration, the "complex" is no doubt the most common and effective. Comp. par. 405*f*. See also:

Double Figuration: **Mendelssohn**, S. w. W. Nos. 7, 32, 42;

**Cramer**, Études 7, 19, 20, 22, 35 (at times compound), 48, 50, 54, 61, 63, 73, 81, 83;

**Chopin**, Prelude op. 28, No. 14; Étude op. 25, No. 12;

**Beethoven**, Sonata op. 7, third mov't, "Minore."

Compound Figuration: **Cramer**, Études 42, 59, 65;

**Chopin**, Preludes op. 28, Nos. 2, 5, 11, 19, 21; Étude op. 25, No. 1.

Complex Figuration: **Mendelssohn**, S. w. W. No. 13, (24);

**Cramer**, Études 5, 8, 21, 31, 36, 38, 46, 79;

**Chopin**, Prelude No. 8; Études op. 25, Nos. 2, 9. — Études for the "Moscheles Method," Nos. 1 and 2. — Fantasie-Impromptu op. 66.

TRIPLE AND QUADRUPLE FIGURATION.

468. Triple or Quadruple figuration is of comparatively rare occurrence in pianoforte music, but not uncommon in orchestral or chamber music. For illustration:

Ex. 366.

1. CRAMER 2.

etc.

BEETHOVEN

later etc.

\*1) Melodic fig. in the upper part, harmonic fig. in the inner and lower parts.

See Chopin: Études op. 25, Nos. 3, 6, and 8.

Études for the "Moscheles Method," No. 3. — Cramer, Études 29, 70.

EXERCISE EIGHTY-ONE.

A. Melody No. 2 of Exercise 75, as follows:

1. 2. 3.

etc.

B. *Larghetto*

BEETHOVEN. *Sym. 2*

To be elaborated as follows (in  $\frac{3}{4}$  measure):

And also in other ways, with original motives.

C. Melody No. 5 of Exercise 75, at the piano, as follows:

1. *Allegro*      2.      3. *Allegretto*      4.

\*1) Melody in tenor, and doubled throughout in the uppermost line. Comp. Ex. 354b.

## PARAPHRASING; OR SIMPLE VARIATION.

**469.** By "paraphrasing" is meant, the elaboration of a given brief theme (8-16 measures) in the manner of *very simple variations*, without altering any essential feature of the theme, but only the style. The best illustrations will be found in **Mozart**, pianoforte Sonata No. XII, Schirmer ed. (2nd movement); in the Chaconnes of **Händel**; and in the simpler variations of **Beethoven** (*e.g.*, 13 Variations in A; 9 Var. in C minor; 6 Var. in F major; 9 Var. in A; 8 Var. in C; etc.) **These very themes may be utilized**, after or before being analyzed.

**Leading points and suggestions:** (1) The rhythm (elaboration in a rhythm of 2, 3 or 4 notes to an original beat). — (2) Location of the rhythmic figure (figural sopr., or bass, or inner part; alternating parts; running voice). — (3) The melody retained nearly or quite intact and the harmony changed, or *vice versa*. — (4) The register of the melody (melody transferred to a higher or lower octave, or to another part; transferred entire, or in sections). — (5) Change of mode (major to minor, or *vice versa*). — (6) Change of rhythm or of measure (from duple to triple, or *vice versa*).

---
